RATIONAL NUMBERS

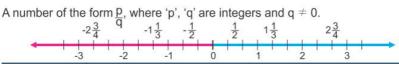

A rational number is a number that can be expressed as a fraction (ratio) in the form ^a/_b, where a and b are integers and b is not zero.

Examples: $\frac{1}{2}$, 8, $\frac{5}{3}$, $\sqrt{4}$, $7^{1}/_{9}$, -12, 6.25, 0.31 $\overline{1}$

When a rational number fraction is divided to form a decimal value, it becomes a terminating or repeating decimal.

 $^{2}/_{5}$ can be represented as $^{2}/_{5.0}$ which is a terminating $\frac{1}{3}$ can be represented as $\frac{0.3}{3.0}$ which is a repeating

Property	Operations on Rational Numbers			
Name	Addition	Subtraction	Multiplication	Division*
Closure	a + b ∈ Q	a-b∈Q	a×b∈Q	a ÷ b ∈ Q
Commutative	a+b=b+a	a-b≠b-a	$a \times b = b \times a$	a÷b≠b÷a
Associative	(a + b) + c = $a + (b + c)$	(a - b) - c ≠ a - (b - c)	$(a \times b) \times c$ = $a \times (b \times c)$	(a ÷ b) ÷ c ≠ a ÷ (b ÷ c)
Distributive	a × (b + c) = ab + ac	a × (b - c) = ab - ac	Not applicable	Not applicable

Where a, b, c ∈ Q (set of rational numbers), *b is a non-zero rational number

01.

Answer:

If $\frac{a}{b}$ is a fraction and m is a non-zero integer, then $\frac{a}{b} = \frac{a \times m}{b \times m}$

(i)
$$\frac{-3}{5} = \frac{-3 \times 4}{5 \times 4} = \frac{-12}{20}$$

(ii)
$$\frac{-3}{5} = \frac{-3 \times -6}{5 \times -6} = \frac{18}{-30}$$

$$\text{(iii)} \frac{-3}{5} = \frac{-3 \times 7}{5 \times 7} = \frac{-21}{35}$$

$$(iV)\frac{-3}{5} = \frac{-3 \times -8}{5 \times -8} = \frac{24}{-40}$$

O2.

Answer:

If $\frac{a}{b}$ is a rational number and m is a common divisor of a and b, then $\frac{a}{b} = \frac{a \div m}{b \div m}$

$$\therefore \frac{-42}{98} = \frac{-42 \div 14}{98 \div 14} = \frac{-3}{7}$$

Q3.

Answer:

If $\frac{a}{b}$ is a rational integer and m is a common divisor of a and b, then $\frac{a}{b} = \frac{a \div m}{b \div m}$

$$\therefore \frac{-48}{60} = \frac{-48 \div 12}{60 \div 12} = \frac{-4}{5}$$

Downloaded from www.studiestoday.com

A rational number $\frac{a}{b}$ is said to be in the standard form if a and b have no common divisor other than unity and b>0

(i) The greatest common divisor of 12 and 30 is 6

$$\therefore \frac{-12}{30} = \frac{-12 \div 6}{30 \div 6} = \frac{-2}{5}$$
 (In the standard form)

(ii)The greatest common divisor of 14 and 49 is 7.

$$\therefore \frac{-14}{49} = \frac{-14 \div 7}{49 \div 7} = \frac{-2}{7}$$
 (In the standard form)

(iii)
$$\frac{24}{-64} = \frac{24 \times (-1)}{-64 \times -1} = \frac{-24}{64}$$

The greatest common divisor of 24 and 64 is 8

$$\therefore \frac{-24}{64} = \frac{-24 \div 8}{64 \div 8} = \frac{-3}{8}$$
 (In the standard form)

(iv)
$$\frac{-36}{-63} = \frac{-36 \times (-1)}{-63 \times -1} = \frac{36}{63}$$

The greatest common divisor of 36 and 63 is 9

$$\therefore \frac{36}{63} = \frac{36 \div 9}{63 \div 9} = \frac{4}{7}$$
 (In the standard form)

Q5.

Answer:

We know:

- (i) Every positive rational number is greater than 0.
- (ii) Every negative rational number is less than 0.

Thus, we have:

(i) $\frac{3}{8}$ is a positive rational number.

$$\frac{3}{8} > 0$$

(ii) $\frac{-2}{9}$ is a negative rational number. $\therefore \frac{-2}{9} < 0$

$$\therefore \frac{-2}{9} < 0$$

(iii) $\frac{-3}{4}$ is a negative rational number $\therefore \frac{-3}{4} < 0$

$$\therefore \frac{-3}{4} < 0$$

 $\frac{1}{4}$ is a positive rational number. $\because \frac{1}{4} > 0$

$$\frac{1}{4} > 0$$

Combining the two inequalities, we get: $\frac{-3}{4} < \frac{1}{4}$

$$\frac{-3}{4} < \frac{1}{4}$$

(iv)Both $\frac{-5}{7}$ and $\frac{-4}{7}$ have the same denominator, that is, 7.

So, we can directly compare the numerators.

$$\therefore \frac{-5}{7} < \frac{-4}{7}$$

(v)The two rational numbers are $\frac{2}{3}$ and $\frac{3}{4}$

The LCM of the denominators 3 and 4 is 12.

$$\frac{2}{3} = \frac{2 \times 4}{3 \times 4} = \frac{8}{12}$$

$$\frac{3}{4} = \frac{3 \times 3}{4 \times 3} = \frac{9}{12}$$

$$\frac{8}{12} < \frac{9}{12}$$

$$\frac{2}{3} < \frac{3}{4}$$

(vi)The two rational numbers are $\frac{-1}{2}$ and -1.

We can write $-1 = \frac{-1}{1}$.

The LCM of the denominators 2 and 1 is 2.

$$\frac{-1}{2} = \frac{-1 \times 1}{2 \times 1} = \frac{-1}{2}$$

$$\begin{array}{l} \frac{-1}{1} = \frac{-1 \times 2}{1 \times 2} = \frac{-2}{2} \\ \because \frac{-2}{1} < \frac{-1}{1} \\ \because -1 < \frac{-1}{2} \end{array}$$

$$\because \frac{-2}{1} < \frac{-1}{1}$$

Q6.

Answer:

1. The two rational numbers are $\frac{-4}{3}$ and $\frac{-8}{7}$.

The LCM of the denominators 3 and 7 is 21.

Now.

$$\frac{-4}{3} = \frac{-4 \times 7}{3 \times 7} = \frac{-28}{21}$$

$$\frac{-8}{7} = \frac{-8 \times 3}{7 \times 3} = \frac{-24}{21}$$

Further,

$$\frac{-28}{21} < \frac{-24}{21}$$

$$\therefore \frac{-4}{3} < \frac{-8}{7}$$

2. The two rational numbers are $\frac{7}{-9}$ and $\frac{-5}{8}$.

The first fraction can be expressed as $\frac{7}{-9} = \frac{7 \times -1}{-9 \times -1} = \frac{-7}{9}$

The LCM of the denominators 9 and 8 is 72.

Now,

$$\frac{-7}{9} = \frac{-7 \times 8}{9 \times 8} = \frac{-56}{72}$$

Also.

$$\frac{-5}{8} = \frac{-5 \times 9}{8 \times 9} = \frac{-45}{72}$$

Further

$$\frac{-56}{72} < \frac{-45}{72}$$

$$\frac{7}{100} < \frac{-5}{8}$$

3. The two rational numbers are $\frac{-1}{3}$ and $\frac{4}{-5}$

$$\frac{4}{-5} = \frac{4 \times -1}{-5 \times -1} = \frac{-4}{5}$$

The LCM of the denominators 3 and 5 is 15.

Now,

$$\frac{-1}{3} = \frac{-1 \times 5}{3 \times 5} = \frac{-5}{15}$$

Also,

$$\frac{-4}{5} = \frac{-4 \times 3}{5 \times 3} = \frac{-12}{15}$$

Further.

$$\frac{-12}{15} < \frac{-5}{15}$$

$$\frac{4}{5} < \frac{-1}{3}$$

4. The two rational numbers are $\frac{9}{-13}$ and $\frac{7}{-12}$.

Now,
$$\frac{9}{-13} = \frac{9 \times -1}{-13 \times -1} = \frac{-9}{13}$$
 and $\frac{7}{-12} = \frac{7 \times -1}{-12 \times -1} = \frac{-7}{12}$

The LCM of the denominators 13 and 12 is 156.

Now,

$$\frac{-9}{13} = \frac{-9 \times 12}{13 \times 12} = \frac{-108}{156}$$

Also,

$$\frac{-7}{12} = \frac{-7 \times 13}{12 \times 13} = \frac{-91}{156}$$

Further,

$$\frac{-108}{156} < \frac{-91}{156}$$

$$\frac{9}{13} < \frac{7}{12}$$

5. The two rational numbers are $\frac{4}{-5}$ and $\frac{-7}{10}$

$$\therefore \frac{4}{-5} = \frac{4 \times -1}{-5 \times -1} = \frac{-4}{5}$$

The LCM of the denominators 5 and 10 is 10.

$$\frac{-4}{5} = \frac{-4 \times 2}{5 \times 2} = \frac{-8}{10}$$

Also,

$$\frac{-7}{10} = \frac{-7 \times 1}{10 \times 1} = \frac{-7}{10}$$

Further,

$$\frac{-8}{10} < \frac{-7}{10}$$

$$\frac{-4}{5} < \frac{-7}{10}$$
, or, $\frac{4}{-5} < \frac{-7}{10}$

6. The two rational numbers are $\frac{-12}{5}$ and -3. -3 can be written as $\frac{-3}{1}$.

The LCM of the denominators is 5.

Now.

$$\frac{-3}{1} = \frac{-3 \times 5}{1 \times 5} = \frac{-15}{5}$$

Because $\frac{-15}{5}<\frac{-12}{5}$, we can conclude that $-3<\frac{-12}{5}$

Q7.

Thus.

$$\tfrac{-3}{7}>\tfrac{6}{-13}$$

(ii) We will write each of the given numbers with positive denominators

One number =
$$\frac{5}{-13} = \frac{5 \times (-1)}{-13 \times (-1)} = \frac{-5}{13}$$

Other number =
$$\frac{-35}{91}$$

LCM of 13 and 91 = 91

$$\therefore \frac{-5}{13} = \frac{-5\times7}{13\times7} = \frac{-35}{91}$$
 and $\frac{-35}{91}$

Clearly.

$$-35 = -35$$

$$\therefore \frac{-35}{91} = \frac{-35}{91}$$

$$\frac{-5}{13} = \frac{-35}{91}$$

(iii) We will write each of the given numbers with positive denominators.

One number = -2

We can write -2 as $\frac{-2}{1}$ Other number = $\frac{-13}{5}$

LCM of 1 and 5 = 5

$$\therefore \frac{-2}{1} = \frac{-2\times5}{1\times5} = \frac{-10}{5} \text{ and } \frac{-13}{5} = \frac{-13\times1}{5\times1} = \frac{-13}{5}$$

Clearly.

$$-10 > -13$$

$$\frac{-10}{5} > \frac{-13}{5}$$

$$\frac{-2}{1} > \frac{-13}{5}$$

$$-2 > \frac{-13}{5}$$

(iv) We will write each of the given numbers with positive denominators.

One number =
$$\frac{-2}{3}$$

One number =
$$\frac{-2}{3}$$

Other number = $\frac{5}{-8} = \frac{5 \times (-1)}{-8 \times (-1)} = \frac{-5}{8}$

LCM of 3 and 8 = 24

$$\therefore \frac{-2}{3} = \frac{-2\times8}{3\times8} = \frac{-16}{24} \text{ and } \frac{-5}{8} = \frac{-5\times3}{8\times3} = \frac{-15}{24}$$

Clearly,

$$-16 < -15$$

$$\therefore \frac{-16}{24} < \frac{-15}{24}$$

$$\frac{-2}{2} < \frac{-5}{2}$$

$$\frac{-2}{3} < \frac{5}{-8}$$

(V)
$$\frac{-3}{-5} = \frac{-3 \times -1}{-5 \times -1} = \frac{3}{5}$$

$$\frac{3}{5}$$
 is a positive number.

Because every positive rational number is greater than 0, $\frac{3}{5} > 0 \Rightarrow 0 < \frac{3}{5}$

(vi) We will write each of the given numbers with positive denominators

One number = $\frac{-8}{9}$

Other number =
$$\frac{-9}{10}$$

LCM of 9 and 10 = 90

$$\therefore \frac{-8}{9} = \frac{-8 \times 10}{9 \times 10} = \frac{-80}{90} \text{ and } \frac{-9}{10} = \frac{-9 \times 9}{10 \times 9} = \frac{-81}{90}$$

Clearly,

$$-81 < -80$$

$$\frac{-81}{90} < \frac{-80}{90}$$

Thus,

$$\frac{-9}{10} < \frac{-8}{9}$$

Q8.

Answer

(i) We will write each of the given numbers with positive denominators.

We have

$$\frac{4}{-9} = \frac{4 \times \left(-1\right)}{-9 \times \left(-1\right)} = \frac{-4}{9} \text{ and } \frac{7}{-18} = \frac{7 \times \left(-1\right)}{-18 \times \left(-1\right)} = \frac{-7}{18}$$

Thus, the given numbers are $\frac{-4}{9}$, $\frac{-5}{12}$, $\frac{-7}{18}$ and $\frac{-2}{3}$.

LCM of 9, 12, 18 and 3 is 36.

Now

$$\frac{-4}{9} = \frac{-4 \times 4}{9 \times 4} = \frac{-16}{36}$$

$$\frac{-5}{12} = \frac{-5 \times 3}{12 \times 3} = \frac{-15}{36}$$

$$\frac{-7}{18} = \frac{-7 \times 2}{18 \times 2} = \frac{-14}{36}$$

$$\frac{-2}{3} = \frac{-2 \times 12}{3 \times 12} = \frac{-24}{36}$$

Clearly,

$$\frac{-24}{36} < \frac{-16}{36} < \frac{-15}{36} < \frac{-14}{36}$$

$$\therefore \frac{-2}{3} < \frac{-4}{9} < \frac{-5}{12} < \frac{-7}{18}$$

That is

$$\frac{-2}{3} < \frac{4}{-9} < \frac{-5}{12} < \frac{7}{-18}$$

(ii) We will write each of the given numbers with positive denominators.

We have

$$\frac{5}{-12} = \frac{5 \times (-1)}{-12 \times (-1)} = \frac{-5}{12} \text{ and } \frac{9}{-24} = \frac{9 \times (-1)}{-24 \times (-1)} = \frac{-9}{24}$$

Thus, the given numbers are $\frac{-3}{4}$, $\frac{-5}{12}$, $\frac{-7}{16}$ and $\frac{-9}{24}$.

LCM of 4, 12, 16 and 24 is 48.

Now

$$\frac{-3}{4} = \frac{-3 \times 12}{4 \times 12} = \frac{-36}{48}$$

$$\frac{-5}{12} = \frac{-5 \times 4}{12 \times 4} = \frac{-20}{48}$$

$$\frac{-7}{16} = \frac{-7 \times 3}{16 \times 3} = \frac{-21}{48}$$

$$\frac{-9}{24} = \frac{-9 \times 2}{24 \times 2} = \frac{-18}{48}$$

Clearly,

$$\frac{-36}{48} < \frac{-21}{48} < \frac{-20}{48} < \frac{-18}{48}$$

$$\therefore \frac{-3}{4} < \frac{-7}{16} < \frac{-5}{12} < \frac{-9}{24}$$

That is

$$\frac{-3}{4} < \frac{-7}{16} < \frac{5}{-12} < \frac{9}{-24}$$

(iii) We will write each of the given numbers with positive denominators.

We have:

$$\frac{3}{-5} = \frac{3 \times (-1)}{-5 \times (-1)} = \frac{-3}{5}$$

Thus, the given numbers are $\frac{-3}{5}$, $\frac{-7}{10}$, $\frac{-11}{15}$ and $\frac{-13}{20}$.

LCM of 5, 10, 15 and 20 is 60.

Now.

$$\frac{-3}{5} = \frac{-3 \times 12}{5 \times 12} = \frac{-36}{60}$$

$$\frac{-7}{10} = \frac{-7 \times 6}{10 \times 6} = \frac{-42}{60}$$

$$\frac{-11}{15} = \frac{-11 \times 4}{15 \times 4} = \frac{-44}{60}$$

$$\frac{-13}{20} = \frac{-13 \times 3}{20 \times 3} = \frac{-39}{60}$$

Clearly.

$$\frac{-44}{60} < \frac{-42}{60} < \frac{-39}{60} < \frac{-36}{60}$$

$$\therefore \frac{-11}{15} < \frac{-7}{10} < \frac{-13}{20} < \frac{-3}{5}$$

That is

$$\frac{-11}{15} < \frac{-7}{10} < \frac{-13}{20} < \frac{3}{-5}$$

(iv) We will write each of the given numbers with positive denominators

We have

$$\frac{13}{-28} = \frac{13 \times (-1)}{-28 \times (-1)} = \frac{-13}{28}$$

Thus, the given numbers are $\frac{-4}{7}$, $\frac{-9}{14}$, $\frac{-13}{28}$ and $\frac{-23}{42}$.

LCM of 7, 14, 28 and 42 is 84.

Now,

$$\frac{-4}{7} = \frac{-4 \times 12}{7 \times 12} = \frac{-48}{84}$$

$$\frac{-9}{14} = \frac{-9 \times 6}{14 \times 6} = \frac{-54}{84}$$

$$\frac{-13}{28} = \frac{-13 \times 3}{28 \times 3} = \frac{-39}{84}$$

$$\frac{-23}{42} = \frac{-23 \times 2}{42 \times 2} = \frac{-46}{84}$$

Clearly,

$$\frac{-54}{84} < \frac{-48}{84} < \frac{-46}{84} < \frac{-39}{84}$$

$$\therefore \frac{-9}{14} < \frac{-4}{7} < \frac{-23}{42} < \frac{-13}{28}.$$

That is

$$\frac{-9}{14} < \frac{-4}{7} < \frac{-23}{42} < \frac{13}{-28}$$

Q9.

Answer:

(i) We will first write each of the given numbers with positive denominators. We have:

$$\frac{8}{-3} = \frac{8 \times (-1)}{-3 \times (-1)} = \frac{-8}{3}$$

Thus, the given numbers are $-2,\ \frac{-13}{6}\ ,\ \frac{-8}{3}\ \ {\rm and}\ \ \frac{1}{3}$

LCM of 1, 6, 3 and 3 is 6

Now.

$$\frac{-2}{1} = \frac{-2 \times 6}{1 \times 6} = \frac{-12}{6}$$

$$\frac{-13}{6} = \frac{-13 \times 1}{6 \times 1} = \frac{-13}{6}$$

$$\frac{-8}{3} = \frac{-8 \times 2}{3 \times 2} = \frac{-16}{6}$$

and

$$\frac{1}{3} = \frac{1 \times 2}{3 \times 2} = \frac{2}{6}$$

$$\frac{2}{6} > \frac{-12}{6} > \frac{-13}{6} > \frac{-16}{6}$$

.:
$$\frac{1}{3} > -2 > \frac{-13}{6} > \frac{-8}{3}$$
 i.e $\frac{1}{3} > -2 > \frac{-13}{6} > \frac{8}{-3}$

(ii) We will first write each of the given numbers with positive denominators. We have:

$$\frac{7}{-15} = \frac{7 \times (-1)}{-15 \times (-1)} = \frac{-7}{15}$$
 and $\frac{17}{-30} = \frac{17 \times (-1)}{-30 \times (-1)} = \frac{-17}{30}$

Thus, the given numbers are $\frac{-3}{10}$, $\frac{-7}{15}$, $\frac{-11}{20}$ and $\frac{-17}{30}$

LCM of 10, 15, 20 and 30 is 60

$$\frac{-3}{10} = \frac{-3 \times 6}{10 \times 6} = \frac{-18}{60}$$

$$\frac{-7}{15} = \frac{-7 \times 4}{15 \times 4} = \frac{-28}{60}$$

$$\frac{-11}{20} = \frac{-11 \times 3}{20 \times 3} = \frac{-33}{60}$$

$$\frac{-17}{30} = \frac{-17 \times 2}{30 \times 2} = \frac{-34}{60}$$

$$\frac{-18}{60} > \frac{-28}{60} > \frac{-33}{60} > \frac{-34}{60}$$

$$\therefore \tfrac{-3}{10} > \tfrac{-7}{15} > \tfrac{-11}{20} > \tfrac{-17}{30} \text{. i.e } \tfrac{-3}{10} > \tfrac{7}{-15} > \tfrac{-11}{20} > \tfrac{17}{-30}$$

(iii) We will first write each of the given numbers with positive denominators. We have

$$\frac{23}{-24} = \frac{23 \times (-1)}{-24 \times (-1)} = \frac{-23}{24}$$

Thus, the given numbers are $\frac{-5}{6}$, $\frac{-7}{12}$, $\frac{-13}{18}$ and $\frac{-23}{94}$

LCM of 6, 12, 18 and 24 is 72

Now,

$$\frac{-5}{6} = \frac{-5 \times 12}{6 \times 12} = \frac{-60}{72}$$

$$\frac{-7}{12} = \frac{-7 \times 6}{12 \times 6} = \frac{-42}{72}$$

$$\frac{-13}{18} = \frac{-13 \times 4}{18 \times 4} = \frac{-52}{79}$$

$$\frac{-23}{24} = \frac{-23 \times 3}{24 \times 3} = \frac{-69}{72}$$

Clearly,

$$\frac{-42}{72} > \frac{-52}{72} > \frac{-60}{72} > \frac{-69}{72}$$

$$\frac{-7}{12} > \frac{-13}{18} > \frac{-5}{6} > \frac{-23}{24}$$
. i.e $\frac{-7}{12} > \frac{-13}{18} > \frac{-5}{6} > \frac{23}{24}$

(iv) The given numbers are $\frac{-10}{11}$, $\frac{-19}{22}$, $\frac{-23}{33}$ and $\frac{-39}{44}$

LCM of 11, 22, 33 and 44 is 132

Now,

$$\frac{-10}{11} = \frac{-10 \times 12}{11 \times 12} = \frac{-120}{132}$$

$$\frac{-19}{22} = \frac{-19 \times 6}{22 \times 6} = \frac{-114}{132}$$

$$\frac{-23}{33} = \frac{-23 \times 4}{33 \times 4} = \frac{-92}{132}$$

and

$$\frac{-39}{44} = \frac{-39 \times 3}{44 \times 3} = \frac{-117}{132}$$

Clearly,

$$\frac{-92}{132} > \frac{-114}{132} > \frac{-117}{132} > \frac{-120}{132}$$

Q10.

Answer:

1. True

A whole number can be expressed as $\frac{a}{b}$, with b=1 and $a\geq 0$. Thus, every whole number is rational

2. True

Every integer is a rational number because any integer can be expressed as

$$rac{a}{b}$$
 , with $b=1$ and $0>a\geq 0$. Thus, every integer is a rational number.

3. False

$$0=rac{a}{b}$$
 , $\ {
m for}\ a=0\ {
m and}\ b
eq 0$. Thus, 0 is a rational and whole number.

Downloaded from www.studiestoday.com RS Aggarwal Solutions Class 8 Mathematics Rational Numbers Ex 1B

Q3.

Answer:

(i) True

A negative number always lies to the left of 0 on the number line.

(ii) False

A negative number always lies to the left of 0 on the number line.

(iii) True

Negative and positive numbers always lie on the opposite sides of 0 on the number line.

(iv) False

The negative sign cancels off and the number becomes $\frac{18}{13}$; it lies to the right of 0 on the number line.

Downloaded from www.studiestoday.com RS Aggarwal Solutions Class 8 Mathematics Rational Numbers Ex 1C

Q1.

Answer:

1.
$$\frac{-2}{5} + \frac{4}{5} = \frac{-2+4}{5} = \frac{2}{5}$$

2.
$$\frac{-6}{11} + \frac{-4}{11} = \frac{-6 + (-4)}{11} = \frac{-6 - 4}{11} = \frac{-10}{11}$$

3.
$$\frac{-11}{8} + \frac{5}{8} = \frac{-11+5}{8} = \frac{-6}{8} = \frac{-3 \times 2}{4 \times 2} = \frac{-3}{4}$$

4.
$$\frac{-7}{3} + \frac{1}{3} = \frac{-7+1}{3} = \frac{-6}{3} = \frac{-3 \times 2}{3} = -2$$

5.
$$\frac{5}{6} + \frac{-1}{6} = \frac{5 + (-1)}{6} = \frac{4}{6} = \frac{2 \times 2}{3 \times 2} = \frac{2}{3}$$

6.
$$\frac{-17}{15} + \frac{-1}{15} = \frac{-17 + (-1)}{15} = \frac{-17 - 1}{15} = \frac{-18}{15} = \frac{-6 \times 3}{5 \times 3} = \frac{-6}{5}$$

Q2.

Answer

1. The denominators of the given rational numbers are 4 and 5.

LCM of 4 and 5 is 20.

Now.

$$\frac{3}{4} = \frac{3 \times 5}{4 \times 5} = \frac{15}{20}$$
 and $\frac{-3}{5} = \frac{-3 \times 4}{5 \times 4} = \frac{-12}{20}$

$$\therefore \frac{3}{4} + \frac{-3}{5} = \frac{15}{20} + \frac{-12}{20} = \frac{15 + (-12)}{20} = \frac{15 - 12}{20} = \frac{3}{20}$$

2. The denominators of the given rational numbers are 8 and 12.

LCM of 8 and 12 is 24.

Now

$$\frac{5}{8} = \frac{5 \times 3}{8 \times 3} = \frac{15}{24}$$
 and $\frac{-7}{12} = \frac{-7 \times 2}{12 \times 2} = \frac{-14}{24}$

$$\therefore \frac{5}{8} + \frac{-7}{12} = \frac{15}{24} + \frac{-14}{24} = \frac{15 + (-14)}{24} = \frac{15 - 14}{24} = \frac{1}{24}$$

3. The denominators of the given rational numbers are 9 and 6.

LCM of 9 and 6 is 18.

Now.

$$\frac{-8}{9} = \frac{-8 \times 2}{9 \times 2} = \frac{-16}{18}$$
 and $\frac{11}{6} = \frac{11 \times 3}{6 \times 3} = \frac{33}{18}$

4. The denominators of the given rational numbers are 16 and 24.

LCM of 16 and 24 is 48

Now,

$$\frac{-5}{16} = \frac{-5 \times 3}{16 \times 3} = \frac{-15}{48}$$
 and $\frac{7}{24} = \frac{7 \times 2}{24 \times 2} = \frac{14}{48}$

$$\because \frac{-5}{16} + \frac{7}{24} = \frac{-15}{48} + \frac{14}{48} = \frac{-15+14}{48} = \frac{-1}{48}$$

5. We will first write each of the given numbers with positive denominators

$$\frac{7}{-18} = \frac{7 \times (-1)}{-18 \times (-1)} = \frac{-7}{18}$$

The denominators of the given rational numbers are 18 and 27.

LCM of 18 and 27 is 54

Now,

$$\frac{-7}{18} = \frac{-7 \times 3}{18 \times 3} = \frac{-21}{54}$$
 and $\frac{8}{27} = \frac{8 \times 2}{27 \times 2} = \frac{16}{54}$

$$\therefore \frac{7}{-18} + \frac{8}{27} = \frac{-21}{54} + \frac{16}{54} = \frac{-21+16}{54} = \frac{-5}{54}$$

6. We will first write each of the given numbers with positive denominators

$$\frac{1}{-12} = \frac{1 \times (-1)}{-12 \times (-1)} = \frac{-1}{12} \text{ and } \frac{2}{-15} = \frac{2 \times (-1)}{-15 \times (-1)} = \frac{-2}{15}$$

The denominators of the given rational numbers are 12 and 15.

LCM of 12 and 15 is 60.

Now.

$$\frac{-1}{12} = \frac{-1 \times 5}{12 \times 5} = \frac{-5}{60}$$
 and $\frac{-2}{15} = \frac{-2 \times 4}{15 \times 4} = \frac{-8}{60}$

$$\therefore \frac{1}{-12} + \frac{2}{-15} = \frac{-5}{60} + \frac{-8}{60} = \frac{-5 + (-8)}{60} = \frac{-5 - 8}{60} = \frac{-13}{60}$$

7. We can write -1 as $\frac{-1}{1}$.

The denominators of the given rational numbers are 1 and 4

LCM of 1 and 4 is 4

Now

$$\frac{-1}{1} = \frac{-1 \times 4}{1 \times 4} = \frac{-4}{4}$$
 and $\frac{3}{4} = \frac{3 \times 1}{4 \times 1} = \frac{3}{4}$

$$\therefore -1 + \frac{3}{4} = \frac{-4}{4} + \frac{3}{4} = \frac{-4+3}{4} = \frac{-1}{4}$$

8. We can write 2 as $\frac{2}{1}$.

The denominators of the given rational numbers are 1 and 4.

LCM of 1 and 4 is 4

Now,

$$\frac{2}{1} = \frac{2 \times 4}{1 \times 4} = \frac{8}{4}$$
 and $\frac{-5}{4} = \frac{-5 \times 1}{4 \times 1} = \frac{-5}{4}$

$$\therefore 2 + \frac{(-5)}{4} = \frac{8}{4} + \frac{(-5)}{4} = \frac{8 + (-5)}{4} = \frac{8 - 5}{4} = \frac{3}{4}$$

9. We can write 0 as $\frac{0}{1}$

The denominators of the given rational numbers are 1 and 5.

LCM of 1 and 5 is 5, that is, (1×5) .

Now,

$$\frac{0}{1}=\frac{0\times5}{1\times5}=\frac{0}{5}=0$$
 and $\frac{-2}{5}=\frac{-2\times1}{5\times1}=\frac{-2}{5}$

Q3.

Answer

1. LHS =
$$\frac{-12}{5} + \frac{2}{7}$$

LCM of 5 and 7 is 35.

$$\frac{-12\times7}{5\times7} + \frac{2\times5}{7\times5} = \frac{-84}{35} + \frac{10}{35} = \frac{-84+10}{35} = \frac{-74}{35}$$

RHS =
$$\frac{2}{7} + \frac{-12}{5}$$

LCM of 5 and 7 is 35.

$$\frac{2\times5}{7\times5} + \frac{-12\times7}{5\times7} = \frac{10}{35} + \frac{-84}{35} = \frac{10-84}{35} = \frac{-74}{35}$$

$$\therefore \frac{-12}{5} + \frac{2}{7} = \frac{2}{7} + \frac{-12}{5}$$

2. LHS =
$$\frac{-5}{8} + \frac{-9}{13}$$

LCM of 8 and 13 is 104.

$$\frac{-5 \times 13}{8 \times 13} + \frac{-9 \times 8}{13 \times 8} = \frac{-65}{104} + \frac{-72}{104} = \frac{-65 + (-72)}{104} = \frac{-65 - 72}{104} = \frac{-137}{104}$$

RHS =
$$\frac{-9}{13} + \frac{-5}{8}$$

LCM of 13 and 8 is 104.

$$\frac{-9 \times 8}{13 \times 8} + \frac{-5 \times 13}{8 \times 13} = \frac{-72}{104} + \frac{-65}{104} = \frac{-72 - 65}{104} = \frac{-137}{104}$$

$$\therefore \frac{-5}{8} + \frac{-9}{13} = \frac{-9}{13} + \frac{-5}{8}$$

3. LHS =
$$\frac{3}{1} + \frac{-7}{12}$$

LCM of 1 and 12 is 12

$$\frac{3 \times 12}{1 \times 12} + \frac{-7 \times 1}{12 \times 1} = \frac{36}{12} + \frac{-7}{12} = \frac{36 + (-7)}{12} = \frac{36 - 7}{12} = \frac{29}{12}$$

RHS =
$$\frac{-7}{12} + \frac{3}{1}$$

LCM of 12 and 1 is 12

$$\frac{-7 \times 1}{12 \times 1} + \frac{3 \times 12}{1 \times 12} = \frac{-7}{12} + \frac{36}{12} = \frac{-7 + 36}{12} = \frac{29}{12}$$

$$\therefore 3 + \frac{-7}{12} = \frac{-7}{12} + 3$$

4. LHS =
$$\frac{2}{-7} + \frac{12}{-35}$$

We will write the given numbers with positive denominators.

$$\frac{2}{-7} = \frac{2 \times (-1)}{-7 \times (-1)} = \frac{-2}{7}$$
 and $\frac{12}{-35} = \frac{12 \times (-1)}{-35 \times (-1)} = \frac{-12}{35}$

LCM of 7 and 35 is 35

$$\frac{-2\times5}{7\times5} + \frac{-12\times1}{35\times1} = \frac{-10}{35} + \frac{-12}{35} = \frac{-10+(-12)}{35} = \frac{-10-12}{35} = \frac{-22}{35}$$

RHS =
$$\frac{12}{-35} + \frac{2}{-7}$$

We will write the given numbers with positive denominators

$$\frac{12}{-35} = \frac{12 \times \left(-1\right)}{-35 \times \left(-1\right)} = \frac{-12}{35} \text{ and } \frac{2}{-7} = \frac{2 \times \left(-1\right)}{-7 \times \left(-1\right)} = \frac{-2}{7}$$

LCM of 35 and 7 is 35.

$$\frac{-2\times5}{7\times5} + \frac{-12\times1}{35\times1} = \frac{-10}{35} + \frac{-12}{35} = \frac{-10+(-12)}{35} = \frac{-10-12}{35} = \frac{-22}{35}$$

$$\therefore \frac{2}{-7} + \frac{12}{-35} = \frac{12}{-35} + \frac{2}{-7}$$

Q4.

Answer:

LHS =
$$\left\{ \left(\frac{3}{4} + \frac{-2}{5} \right) + \frac{-7}{10} \right\}$$

$$\left\{ \left(\frac{15-8}{20}\right) + \frac{-7}{10} \right\} = \left(\frac{7}{20} + \frac{-7}{10}\right) = \left(\frac{7}{20} + \frac{-14}{20}\right) = \left(\frac{7+\left(-14\right)}{20}\right) = \frac{-7}{20}$$

RHS =
$$\left\{ \frac{3}{4} + \left(\frac{-2}{5} + \frac{-7}{10} \right) \right\}$$

$$\left\{ \frac{3}{4} + \left(\frac{-4}{10} + \frac{-7}{10} \right) \right\} = \left\{ \frac{3}{4} + \left(\frac{-4-7}{10} \right) \right\} = \left\{ \frac{3}{4} + \left(\frac{-11}{10} \right) \right\} = \left(\frac{3}{4} + \frac{-11}{10} \right) \\
= \left(\frac{15}{20} + \frac{-22}{20} \right) = \left(\frac{15-22}{20} \right) = \frac{-7}{20}$$

$$\therefore \left(\frac{3}{4} + \frac{-2}{5}\right) + \frac{-7}{10} = \frac{3}{4} + \left(\frac{-2}{5} + \frac{-7}{10}\right)$$

2. LHS =
$$\left\{ \left(\frac{-7}{11} + \frac{2}{-5} \right) + \frac{-13}{22} \right\}$$

We will first make the denominator positive.

$$\begin{split} &\left\{ \left(\frac{-7}{11} + \frac{2\times(-1)}{-5\times(-1)} \right) + \frac{-13}{22} \right\} = \left\{ \left(\frac{-7}{11} + \frac{-2}{5} \right) + \frac{-13}{22} \right\} \\ &\left\{ \left(\frac{-7}{11} + \frac{-2}{5} \right) + \frac{-13}{22} \right\} = \left\{ \left(\frac{-35}{55} + \frac{-22}{55} \right) + \frac{-13}{22} \right\} = \left\{ \left(\frac{-35 - 22}{55} \right) + \frac{-13}{22} \right\} \\ &= \left(\frac{-57}{55} + \frac{-13}{22} \right) = \frac{-114}{110} + \frac{-65}{110} = \frac{-114 - 65}{110} = \frac{-179}{110} \end{split}$$

$$\text{RHS} = \left\{ \frac{-7}{11} + \left(\frac{2}{-5} + \frac{-13}{22} \right) \right\}$$

We will first make the denominator positive

$$\left\{ \frac{-7}{11} + \left(\frac{2 \times (-1)}{-5 \times (-1)} + \frac{-13}{22} \right) \right\} = \left\{ \frac{-7}{11} + \left(\frac{-2}{5} + \frac{-13}{22} \right) \right\}
\left\{ \frac{-7}{11} + \left(\frac{-2}{5} + \frac{-13}{22} \right) \right\} = \left\{ \frac{-7}{11} + \left(\frac{-44}{110} + \frac{-65}{110} \right) \right\} = \left\{ \frac{-7}{11} + \left(\frac{-44 + (-65)}{110} \right) \right\}
= \frac{-7}{11} + \frac{-109}{110} = \frac{-70}{110} + \frac{-109}{110} = \frac{-70 - 109}{110} = \frac{-179}{110}
$$\therefore \left(\frac{-7}{11} + \frac{2}{-5} \right) + \frac{-13}{22} = \frac{-7}{11} + \left(\frac{2}{-5} + \frac{-13}{22} \right)$$$$

$$\begin{split} &\text{LHS} = -1 + \left(\frac{-2}{3} + \frac{-3}{4}\right) \\ &\left\{\frac{-1}{1} + \left(\frac{-2}{3} + \frac{-3}{4}\right)\right\} = \left\{\frac{-1}{1} + \left(\frac{-8}{12} + \frac{-9}{12}\right)\right\} = \left\{\frac{-1}{1} + \left(\frac{-8-9}{12}\right)\right\} \\ &= \left\{\frac{-1}{1} + \left(\frac{-17}{12}\right)\right\} = \left(\frac{-1}{1} + \frac{-17}{12}\right) = \left(\frac{-1 \times 12}{1 \times 12} + \frac{-17 \times 1}{12 \times 1}\right) = \left(\frac{-12 + \left(-17\right)}{12}\right) \\ &= \left(\frac{-12 - 17}{12}\right) = \frac{-29}{12} \\ &\text{RHS} = \left\{\left(-1 + \frac{-2}{3}\right) + \frac{-3}{4}\right\} \end{split}$$

$$\left\{ \left(\frac{-1}{1} + \frac{-2}{3} \right) + \frac{-3}{4} \right\} = \left\{ \left(\frac{-3}{3} + \frac{-2}{3} \right) + \frac{-3}{4} \right\} = \left\{ \left(\frac{-3-2}{3} \right) + \frac{-3}{4} \right\}$$

$$= \left\{ \left(\frac{-5}{3} \right) + \frac{-3}{4} \right\} = \left(\frac{-5}{3} + \frac{-3}{4} \right) = \left(\frac{-20}{12} + \frac{-9}{12} \right) = \left(\frac{-20-9}{12} \right) = \frac{-29}{12}$$

$$\therefore -1 + \left(\frac{-2}{3} + \frac{-3}{4} \right) = \left(-1 + \frac{-2}{3} \right) + \frac{-3}{4}$$

Q5.

Answer:

(i) Addition is commutative, that is, $oldsymbol{a}+oldsymbol{b}=oldsymbol{b}+oldsymbol{a}.$

Hence, the required solution is
$$\left(\frac{-3}{17}\right) + \left(\frac{-12}{5}\right) = \left(\frac{-12}{5}\right) + \boxed{\left(\frac{-3}{7}\right)}$$

(ii) Addition is commutative, that is, a+b=b+a

Hence, the required solution is $-9 + \frac{-21}{8} = \frac{-21}{8} + \boxed{-9}$

(iii) Addition is associative, that is, (a+b)+c=a+(b+c)

Hence, the required solution is
$$\left(\frac{-8}{13} + \frac{3}{7}\right) + \left(\frac{-13}{4}\right) = \left[\left(\frac{-8}{13}\right)\right] + \left[\frac{3}{7} + \left(\frac{-13}{4}\right)\right]$$
.

(iv) Addition is associative, that is, (a+b)+c=a+(b+c).

Hence, the required solution is
$$-12+\left(\frac{7}{12}+\frac{-9}{11}\right)=\left(-12+\frac{7}{12}\right)+\frac{-9}{11}$$

(iv) Addition is associative, that is, (a+b)+c=a+(b+c)

Hence, the required solution is
$$-12+\left(\frac{7}{12}+\frac{-9}{11}\right)=\left(-12+\frac{7}{12}\right)+\frac{-9}{11}$$

(v) Addition is associative, that is, (a+b)+c=a+(b+c)

Hence, the required solution is
$$\frac{19}{-5} + \left(\frac{-3}{11} + \frac{-7}{8}\right) = \left\{\frac{19}{-5} + \left\lceil \left(\frac{-3}{11}\right) \right\rceil \right\} + \frac{-7}{8}$$
.

(vi) 0 is the additive identity, that is, 0+a=a

Hence, the required solution is
$$\frac{-16}{7} + \boxed{0} = \boxed{0} + \frac{-16}{7} = \frac{-16}{7}$$

Q6.

Answer

The additive inverse of $\frac{a}{b}$ is $\frac{-a}{b}$. Therefore, $\frac{a}{b}+\left(\frac{-a}{b}\right)=0$

- (i) Additive inverse of $\frac{1}{3}$ is $\frac{-1}{3}$.
- (ii) Additive inverse of $\ \frac{23}{9}\ is \frac{-23}{9}$.
- (iii) Additive inverse of -18 is 18
- (iv) Additive inverse of $\frac{-17}{8}$ is $\frac{17}{8}$.
- (v) In the standard form, we write $rac{15}{-4}$ as $rac{-15}{4}$.

Hence, its additive inverse is $\frac{15}{4}\,$

(vi) We can write:

$$\frac{-16}{-5} = \frac{-16 \times (-1)}{-5 \times (-1)} = \frac{16}{5}$$

Hence, its additive inverse is $\frac{-16}{5}$

(vii) Additive inverse of $\frac{-3}{11}$ is $\frac{3}{11}$.

(viii) Additive inverse of 0 is 0

(ix) In the standard form, we write $\frac{19}{-6}$ as $\frac{-19}{6}$.

Hence, its additive inverse is $\frac{19}{6}\,$

(x) We can write:

$$\frac{-8}{-7} = \frac{-8 \times (-1)}{-7 \times (-1)} = \frac{8}{7}$$

Hence, its additive inverse is $\frac{-8}{7}$.

Q7.

Answer:

(i)
$$\left(\frac{1}{3} - \frac{3}{4}\right) = \frac{1}{3} + \left(\text{Additive inverse of } \frac{3}{4}\right)$$
$$= \left(\frac{1}{3} + \frac{-3}{4}\right) = \left(\frac{4}{12} + \frac{-9}{12}\right) = \left(\frac{4-9}{12}\right) = \frac{-5}{12}$$

(ii)
$$\left(\frac{1}{3} - \frac{-5}{6}\right) = \frac{1}{3} + \left(\text{Additive inverse of } \frac{-5}{6}\right)$$

$$= \left(\frac{1}{3} + \frac{5}{6}\right) \text{ (Because the additive inverse of } \frac{-5}{6} \text{ is } \frac{5}{6}\text{)}$$

$$= \left(\frac{2}{6} + \frac{5}{6}\right) = \left(\frac{2+5}{6}\right) = \frac{7}{6}$$

(iii)
$$\left(\frac{-3}{5} - \frac{-8}{9}\right) = \frac{-3}{5} + \left(\text{Additive inverse of } \frac{-8}{9}\right)$$

$$= \left(\frac{-3}{5} + \frac{8}{9}\right) \text{ (Because the additive inverse of } \frac{-8}{9} \text{ is } \frac{8}{9}\text{)}$$

$$= \left(\frac{-27}{45} + \frac{40}{45}\right) = \left(\frac{-27 + 40}{45}\right) = \frac{13}{45}$$

(iv)
$$\left(-1-\frac{-9}{7}\right)=-1+\left(\text{Additive inverse of}\,\frac{-9}{7}\right)$$

$$=\left(\frac{-1}{1}+\frac{9}{7}\right) \text{ (Because the additive inverse of }\frac{-9}{7}\text{ is }\frac{9}{7}\text{)}$$

$$=\left(\frac{-7}{7}+\frac{9}{7}\right)=\left(\frac{-7+9}{7}\right)=\frac{2}{7}$$

(v)
$$\left(1 - \frac{-18}{11}\right) = 1 + \left(\text{Additive inverse of} \frac{-18}{11}\right)$$

$$= \left(\frac{1}{1} + \frac{18}{11}\right) \text{ (Because the additive inverse of } \frac{-18}{11} \text{ is } \frac{18}{11}\text{)}$$

$$= \left(\frac{11}{11} + \frac{18}{11}\right) = \left(\frac{11+18}{11}\right) = \frac{29}{11}$$

$$(\text{vi}) \left(0 - \frac{-13}{9}\right) = 0 + \left(\text{Additive inverse of} \frac{-13}{9}\right)$$

$$= \left(0 + \frac{13}{9}\right) \text{ (Because the additive inverse of } \frac{-13}{9} \text{ is } \frac{13}{9}\text{)}$$

$$= \frac{13}{9}$$

$$(\text{vii}) \left(\frac{-6}{5} - \frac{-32}{13}\right) = \frac{-6}{5} + \left(\text{Additive inverse of} \frac{-32}{13}\right)$$

$$= \left(\frac{-6}{5} + \frac{32}{13}\right) \text{ (Because the additive inverse of } \frac{-32}{13} \text{ is } \frac{32}{13}\text{)}$$

$$= \left(\frac{-78}{65} + \frac{160}{65}\right) = \left(\frac{-78 + 160}{65}\right) = \frac{82}{65}$$

$$(\text{vi}) \left(0 - \frac{-13}{9}\right) = 0 + \left(\text{Additive inverse of} \frac{-13}{9}\right)$$

$$= \left(0 + \frac{13}{9}\right) \text{ (Because the additive inverse of } \frac{-13}{9} \text{ is } \frac{13}{9}\text{)}$$

$$= \frac{13}{9}$$

$$(\text{vii}) \left(\frac{-6}{5} - \frac{-32}{13}\right) = \frac{-6}{5} + \left(\text{Additive inverse of} \frac{-32}{13}\right)$$

$$= \left(\frac{-6}{5} + \frac{32}{13}\right) \text{ (Because the additive inverse of } \frac{-32}{13} \text{ is } \frac{32}{13}\text{)}$$

$$= \left(\frac{-78}{65} + \frac{160}{65}\right) = \left(\frac{-78 + 160}{65}\right) = \frac{82}{65}$$

Q8.

Answer:

(i)
$$\left(\frac{4}{3} + \frac{-2}{3}\right) + \left(\frac{3}{5} + \frac{-11}{5}\right)$$

$$= \left(\frac{4-2}{3}\right) + \left(\frac{3-11}{5}\right)$$

$$= \left(\frac{2}{3} + \frac{-8}{5}\right)$$

$$= \left(\frac{10}{15} + \frac{-24}{15}\right)$$

$$= \left(\frac{10-24}{15}\right)$$

$$= \frac{-14}{15}$$

(ii)
$$\left(\frac{-8}{3} + \frac{-11}{6}\right) + \left(\frac{-1}{4} + \frac{3}{8}\right)$$
 $= \left(\frac{-16}{6} + \frac{-11}{6}\right) + \left(\frac{-2}{8} + \frac{3}{8}\right)$

$$= \left(\frac{-16-11}{6}\right) + \left(\frac{-2+3}{8}\right)$$

$$= \left(\frac{-27}{6} + \frac{1}{8}\right)$$

$$= \left(\frac{-108}{24} + \frac{3}{24}\right)$$

$$= \frac{-105}{24}$$

$$= \frac{35}{8}$$

$$\begin{aligned} &\binom{\text{(iii)}}{\left(\frac{-13}{20} + \frac{7}{10}\right)} + \left(\frac{11}{14} + \frac{-5}{7}\right) \\ &= \left(\frac{-13}{20} + \frac{14}{20}\right) + \left(\frac{11}{14} + \frac{-10}{14}\right) \\ &= \left(\frac{-13+14}{20}\right) + \left(\frac{11-10}{14}\right) \\ &= \left(\frac{1}{20} + \frac{1}{14}\right) \\ &= \left(\frac{7}{140} + \frac{10}{140}\right) \\ &= \left(\frac{7+10}{140}\right) \\ &= \left(\frac{17}{140}\right) \\ &= \frac{17}{140} \end{aligned}$$

09

Answer:

Let the other number be x.

$$\Rightarrow x + \frac{-14}{5} = -2$$

$$\Rightarrow x - \frac{14}{5} = -2$$

$$\Rightarrow x = -2 + \frac{14}{5}$$

$$\Rightarrow x = \frac{(-2) \times 5 + 14}{5}$$

$$\Rightarrow x = \frac{-10 + 14}{5}$$

$$\Rightarrow x = \frac{4}{5}$$

Q10.

Answer:

Let the other number be x.

$$x+rac{5}{6}=rac{-1}{2}$$

 $\Rightarrow x=-rac{1}{2}-rac{5}{6}$

$$\Rightarrow x = -\frac{1}{2} - \frac{1}{6}$$
$$\Rightarrow x = \frac{-3 - 5}{6}$$

$$\Rightarrow x = \frac{-8}{6}$$

$$\Rightarrow x = \frac{-4}{3}$$

Q11.

Answer:

Let the required number be x.

Now,

$$\frac{-5}{8} + x = \frac{-3}{2}$$

$$\Rightarrow \frac{-5}{8} + x + \frac{5}{8} = \frac{-3}{2} + \frac{5}{8}$$
 (Adding $\frac{5}{8}$ to both the sides)

$$\Rightarrow \pmb{x} = \left(\frac{-3}{2} + \frac{5}{8}\right)$$

$$\Rightarrow x = \left(\frac{-12}{8} + \frac{5}{8}\right)$$

$$\Rightarrow x = \left(\frac{-12+5}{8}\right)$$

$$\Rightarrow x = \frac{-7}{9}$$

Hence, the required number is $\frac{-7}{8}$.

Q12.

Answer

Let the required number be x.

Now,

$$\begin{array}{l} -1+x=\frac{5}{7}\\ \Rightarrow -1+x+1=\frac{5}{7}+1 & \text{(Adding 1 to both the sides)} \end{array}$$

$$\Rightarrow x = \left(\frac{5+7}{7}\right)$$

Hence, the required number is $\frac{12}{7}$.

Q13.

Answer

Let the required number be x.

Now.

$$\begin{array}{l} \frac{-2}{3}-x=\frac{-1}{6}\\ \Rightarrow \frac{-2}{3}-x+x=\frac{-1}{6}+x\\ \Rightarrow \frac{-2}{3}=\frac{-1}{6}+x\\ \Rightarrow \frac{-2}{3}=\frac{1}{6}+x\\ \Rightarrow \frac{-2}{3}+\frac{1}{6}=\frac{-1}{6}+x+\frac{1}{6} \quad \text{(Adding x to both the sides)}\\ \Rightarrow \left(\frac{-4}{6}+\frac{1}{6}\right)=x\\ \Rightarrow \left(\frac{-4+1}{6}\right)=x\\ \Rightarrow \frac{-3}{6}=x\\ \Rightarrow \frac{-1\times 3}{2\times 3}=x\\ \Rightarrow \frac{-1}{2}=x \end{array}$$

Hence, the required number is $\frac{-1}{2}$.

Q14.

Answer:

- 1. Zero is a rational number that is its own additive inverse.
- 2. Yes

Consider ab-cd (with a, b, c and d as integers), where b and d are not equal to 0.

ab-cd implies adbd-bcbd implies ad-bcbd

Since ad, bc and bd are integers since integers are closed under the operation of multiplication and ad-bc is an integer since integers are closed under the operation of subtraction, then ad-bcbd

since it is in the form of one integer divided by another and the denominator is not equal to $\boldsymbol{\Omega}$

Since, b and d were not equal to 0

Thus, ab-cd is a rational number.

- 3. Yes, rational numbers are commutative under addition. If *a* and *b* are rational numbers, then the commutative law under addition is a+b=b+a.
- 4. Yes, rational numbers are associative under addition. If a, b and c are rational numbers, then the associative law under addition is a+(b+c)=(a+b)+c.
- 5. No, subtraction is not commutative on rational numbers. In general, for any two rational numbers, $(a-b) \neq (b-a)$.
- 6. Rational numbers are not associative under subtraction. Therefore,

$$a - (b - c) \neq (a - b) - c$$

7. Negative of a negative rational number is a positive rational number.

Q1.

Answer:

(i)

$$\begin{aligned} \frac{\frac{3}{5} \times \frac{-7}{8}}{\frac{-7}{8}} \\ &= \frac{3 \times (-7)}{5 \times 8} \\ &= -\frac{21}{40} \end{aligned}$$

(ii)

$$\frac{-9}{2} \times \frac{5}{4}$$

$$= \frac{(-9) \times 5}{2 \times 4}$$

$$= \frac{-45}{8}$$

(iii)

$$\frac{-6}{11} \times \frac{-5}{3} \\
= \frac{(-6) \times (-5)}{11 \times 3} \\
= \frac{30}{33}$$

Simplifying the above rational number, we get:

$$\frac{30}{33} = \frac{30 \div 3}{33 \div 3} = \frac{10}{11}$$

(iv)

$$\frac{-2}{3} \times \frac{6}{7}$$

$$= \frac{(-2) \times 6}{3 \times 7}$$

$$= \frac{-12}{21}$$

Simplifying the above rational number, we get:

$$\frac{-12}{21} = \frac{-12 \div 3}{21 \div 3} = \frac{-4}{7}$$

(v)

$$\frac{-12}{5} \times \frac{10}{-3}$$

$$= \frac{(-12) \times 10}{5 \times (-3)}$$

$$= \frac{-120}{-15}$$

$$= \frac{120}{15}$$

Simplifying the above rational number, we get:

$$\frac{120}{15} = \frac{120 \div 3}{15 \div 3} = \frac{40}{5} = 8$$

(vi)

$$\frac{25}{-9} \times \frac{3}{-10} \\
= \frac{25 \times 3}{(-9) \times (-10)} \\
= \frac{75}{90}$$

Simplifying the above rational number, we get:

$$\frac{75}{90} = \frac{75 \div 15}{90 \div 15} = \frac{5}{6}$$

(vii)

$$\frac{\frac{5}{-18} \times \frac{-9}{20}}{= \frac{5 \times (-9)}{-18 \times 20}}$$
$$= \frac{-45}{-360}$$
$$= \frac{45}{360}$$

Simplifying the above rational number, we get:

$$\frac{45}{360} = \frac{45 \div 45}{360 \div 45} = \frac{1}{8}$$

(viii)

$$\frac{-13}{15} \times \frac{-25}{26} \\
= \frac{(-13) \times (-25)}{15 \times 26} \\
= \frac{325}{390}$$

Simplifying the above rational number, we get:

$$\frac{325}{390} = \frac{325 \div 5}{390 \div 5} = \frac{65}{78} = \frac{65 \div 13}{78 \div 13} = \frac{5}{6}$$

(ix)

$$\frac{\frac{16}{-21} \times \frac{14}{5}}{= \frac{16 \times 14}{(-21) \times 5}}$$
$$= \frac{224}{107}$$

Simplifying the above rational number, we get:

$$\frac{224}{-105} = \frac{224 \div 7}{(-105) \div 7} = \frac{32}{-15} = \frac{32 \times -1}{-15 \times -1} = \frac{-32}{15}$$

(X)

$$\frac{-7}{6} \times 24$$

$$= \frac{(-7) \times 24}{6}$$

$$= \frac{-168}{6}$$

Simplifying the above rational number, we get:

$$\frac{-168}{6} = \frac{(-168) \div 2}{6 \div 2} = \frac{84}{3} = \frac{-84 \div 3}{3 \div 3} = -28$$

(xi)

$$\begin{aligned} & \frac{7}{24} \times \left(-48 \right) \\ & = \frac{7 \times (-48)}{24} = -\frac{336}{24} \end{aligned}$$

Simplifying the above rational number, we get:

$$\frac{-336}{24} = \frac{-336 \div 24}{24 \div 24} = -14$$

(XII)

$$\frac{-13}{5} \times \left(-10\right) \\
= \frac{(-13) \times (-10)}{5} \\
= \frac{130}{5}$$

Simplifying the above rational number, we get:

$$\frac{130}{5} = \frac{130 \div 5}{5 \div 5} = 26$$

Q2.

Answer:

$$\frac{3}{7} \times \frac{-5}{9} = \frac{-5}{9} \times \frac{3}{7}$$

LHS =
$$\frac{3 \times (-5)}{7 \times 9}$$

= $-\frac{15}{63}$

Simplifying, we get:

$$-\frac{15}{63} = -\frac{15 \div 3}{63 \div 3}$$
$$= -\frac{5}{21}$$

$$RHS = \frac{-5}{9} \times \frac{3}{7}$$

$$=\frac{(-5)\times 3}{9\times 7}$$

63 Simplifying, we get:

$$= \frac{-15 \div 3}{63 \div 3}$$
$$= -\frac{5}{21}$$

(ii)

$$\frac{-8}{7} \times \frac{13}{9} = \frac{13}{9} \times \frac{-8}{7}$$

LHS =
$$\frac{-8}{7} \times \frac{13}{9} = \frac{(-8) \times 13}{7 \times 9} = -\frac{104}{63} \text{ RHS} = \frac{13}{9} \times \frac{-8}{7} = \frac{13 \times (-8)}{9 \times 7} = -\frac{104}{63} \text{ LHS} = \text{RHS}$$

(iii)

$$\frac{-12}{5} \times \frac{7}{-36} = \frac{7}{-36} \times \frac{-12}{5}$$

$$LHS = \frac{-12}{5} \times \frac{7}{-36}$$

$$=\frac{(-12)\times 7}{5\times (-36)}$$

$$5 \times (-36)$$

$$= \frac{84}{180}$$

$$=\frac{84\div12}{180\div12}$$

$$=\frac{7}{15}$$

RHS =
$$\frac{7}{-36} \times \frac{-12}{5}$$

= $\frac{7 \times (-12)}{(-36) \times 5}$
= $\frac{84}{180}$
Simplifying, we get:
= $\frac{84 \div 12}{180 \div 12}$
= $\frac{7}{15}$

(iv)
$$-8 \times \frac{-13}{12} = \frac{-13}{12} \times \left(-8\right)$$

LHS =
$$-8 \times \frac{-13}{12}$$

= $\frac{(-8)\times(-13)}{12}$
= $\frac{104}{12}$
Simplifying, we get:
= $\frac{104 \div 4}{12 \div 4}$

$$RHS = \frac{-13}{12} \times \left(-8\right)$$

$$(-13) \times (-8)$$

$$= \frac{\binom{-13) \times (-8)}{12}}{\frac{104}{}}$$

 $=\frac{26}{3}$

$$= \frac{104:4}{12:4} = \frac{26}{3}$$

Q3.

Answer:

$$\left(\frac{5}{7} \times \frac{12}{13}\right) \times \frac{7}{18} = \frac{5}{7} \times \left(\frac{12}{13} \times \frac{7}{18}\right)$$

$$\begin{split} \mathbf{LHS} &= \left(\frac{5}{7} \times \frac{12}{13}\right) \times \frac{7}{18} \\ &= \frac{5 \times 12}{7 \times 13} \times \frac{7}{18} \\ &= \frac{60}{91} \times \frac{7}{18} \end{split}$$

$$=\frac{1638}{1638}$$

 $=\frac{10}{30}$

$$\begin{aligned} \text{RHS} &= \frac{5}{7} \times \left(\frac{12}{13} \times \frac{7}{18} \right) \\ &= \frac{5}{7} \times \frac{12 \times 7}{13 \times 18} \end{aligned}$$

$$= \frac{5}{7} \times \frac{84}{234}$$

$$=\frac{420}{1638}$$

 $=\frac{10}{1638}$

$$\frac{-13}{24} \times \left(\frac{-12}{5} \times \frac{35}{36}\right) = \left(\frac{-13}{24} \times \frac{-12}{5}\right) \times \frac{35}{36}$$

LHS =
$$\frac{-13}{24} \times \left(\frac{-12}{5} \times \frac{35}{36}\right)$$

$$= \frac{-13}{24} \times \frac{(-12) \times 35}{5 \times 36}$$

$$= \frac{-13}{24} \times \frac{-420}{180}$$

$$= \frac{5460}{4320}$$

$$=\frac{91}{72}$$

$$RHS = \left(\frac{-13}{24} \times \frac{-12}{5}\right) \times \frac{35}{36}$$

$$=\frac{(-13)\times(-12)}{24\times5}\times\frac{35}{36}$$

$$= \frac{156}{120} \times \frac{35}{36}$$
$$= \frac{156 \times 35}{120 \times 36}$$

$$=\frac{156\times35}{120\times36}$$

$$=\frac{5460}{4320}$$

$$=\frac{91}{70}$$

$$\therefore \frac{-13}{24} \times \left(\frac{-12}{5} \times \frac{35}{36}\right) = \left(\frac{-13}{24} \times \frac{-12}{5}\right) \times \frac{35}{36}$$

$$\left(\frac{-9}{5} \times \frac{-10}{3}\right) \times \frac{21}{-4} = \frac{-9}{5} \times \left(\frac{-10}{3} \times \frac{21}{-4}\right)$$

LHS =
$$\left(\frac{-9}{5} \times \frac{-10}{3}\right) \times \frac{21}{-4}$$

$$=\frac{(-9)\times(-10)}{5\times3}\times\frac{21}{-4}$$

$$=\frac{90}{15}\times\frac{21}{-4}$$

$$=\frac{90\times21}{15}$$

$$=-\frac{1890}{60}$$

$$=-\frac{63}{2}$$

$$RHS = \frac{-9}{5} \times \left(\frac{-10}{3} \times \frac{21}{-4}\right)$$

$$=\frac{-9}{5} imes \frac{(-10) imes 21}{3 imes (-4)}$$

$$=\frac{-9}{5}\times\frac{210}{12}$$

$$= \frac{(-9) \times 210}{5 \times 12}$$

$$=-\frac{1890}{60}$$

$$=\frac{-63}{2}$$

$$\therefore \left(\frac{-9}{5} \times \frac{-10}{3}\right) \times \frac{21}{-4} = \frac{-9}{5} \times \left(\frac{-10}{3} \times \frac{21}{-4}\right)$$

Q4.

Answer:

(i)

$$\frac{-23}{17} imes \frac{18}{35} = \frac{18}{35} imes \boxed{\frac{-23}{17}} \qquad \qquad \left(\because oldsymbol{a} imes oldsymbol{b} = oldsymbol{b} imes oldsymbol{a} = oldsymbol{b} imes oldsymbol{a}$$

(ii)

$$-38 \times \frac{-7}{9} = \frac{-7}{9} \times \boxed{-38}$$
 $\left(\because a \times b = b \times a\right)$

$$\left(\frac{\frac{15}{7}\times\frac{-21}{10}}{}\right)\times\frac{-5}{6}=\boxed{\frac{15}{7}}\times\left(\frac{-21}{10}\times\frac{-5}{6}\right)\quad\left[\because a\times\left(b\times c\right)=\left(a\times b\right)\times c\right)\right]$$

$$rac{-12}{5} imes\left(rac{4}{15} imesrac{25}{-16}
ight)=\left(rac{-12}{5} imesrac{4}{15}
ight) imesrac{25}{-16} \qquad \left[\because a imes\left(b imes c
ight)=\left(a imes b
ight) imes c
ight]$$

Q5.

Answer:

(i)

Reciprocal of $\frac{13}{25}$ is $\frac{25}{13}$.

(ii)

Reciprocal of $\frac{-17}{12}$ is $\frac{12}{-17}$, that is, $\frac{-12}{17}$.

Reciprocal of $\frac{-7}{24}$ is $\frac{24}{-7}$, that is, $\frac{-24}{7}$.

Reciprocal of 18 is $\frac{1}{18}$.

(v)

Reciprocal of -16 is $\frac{1}{-16}$, that is, $\frac{-1}{16}$.

Reciprocal of $\frac{-3}{-5}$ is $\frac{-5}{-3}$, that is, $\frac{5}{3}$.

(vii)

Reciprocal of -1 is -1.

Reciprocal of $\frac{0}{2}$ does not exist as $\frac{2}{0} = \infty$.

(ix)

Reciprocal of $\frac{2}{-5}$ is $\frac{-5}{2}$.

Reciprocal of $\frac{-1}{8}$ is -8.

Q6.

We know that
$$\, {m a}^{-1} = {1\over a} \, \, {
m or} \, {m a}^{-1} imes {m a} = 1 \,$$

$$\left(\frac{5}{8}\right)^{-1} = \frac{8}{5}$$

$$\because \frac{5}{8} \times \left(\frac{5}{8}\right)^{-1} = 1$$

$$\left(\frac{-4}{9}\right)^{-1} = \frac{9}{-4} = \frac{-9}{4}$$

$$\because \frac{-4}{9} \times \left(\frac{-4}{9}\right)^{-1} = 1$$
(iii)

$$\left(-7\right)^{-1} = \frac{1}{-7} = \frac{-1}{7}$$

$$\because -7 \times \left(-7\right)^{-1} = 1$$

$$(iv) (-3)^{-1}$$

$$\left(-3\right)^{-1} = \frac{1}{-3} = \frac{-1}{3}$$

$$\therefore \left(-3\right)^{-1} \times \left(-3\right) = 1$$

Q7.

Answer:

LHS=
$$\frac{3}{7}$$
 × $\left(\frac{5}{6} + \frac{12}{13}\right)$

$$= \frac{3}{7} \times \left(\frac{65 + 72}{78}\right)$$

$$=\frac{3}{7} \times \frac{137}{78}$$

$$=\frac{137}{137}$$

$$RHS = \left(\frac{3}{7} \times \frac{5}{6}\right) + \left(\frac{12}{13} \times \frac{3}{7}\right)$$

$$= \frac{3 \times 5}{7 \times 6} + \frac{12 \times 3}{13 \times 7}$$
$$= \frac{15}{42} + \frac{36}{91}$$

$$7 \times 6$$
 13×7 $= \frac{15}{49} + \frac{36}{91}$

$$= \frac{13}{42} + \frac{30}{91}$$
$$= \frac{195 + 216}{546}$$

$$=\frac{137}{102}$$

$$\therefore \frac{3}{7} \times \left(\frac{5}{6} + \frac{12}{13}\right) = \left(\frac{3}{7} \times \frac{5}{6}\right) + \left(\frac{3}{7} \times \frac{12}{13}\right)$$

B

(ii)

LHS
$$= \frac{-15}{4} \times \left(\frac{3}{3} + \frac{-12}{5}\right)$$
 $= \frac{-15}{4} \times \left(\frac{15-84}{35}\right)$
 $= \frac{-15}{4} \times \left(\frac{15-84}{35}\right)$
 $= \frac{-15}{4} \times \left(\frac{15-84}{35}\right)$
 $= \frac{-15}{4} \times \left(\frac{15-84}{35}\right)$
 $= \frac{-15}{4} \times \frac{15-84}{35}$
 $= \frac{1015}{205}$
 $= \frac{1015}{205}$
 $= \frac{1015}{205}$
 $= \frac{1015}{205}$
 $= \frac{1015}{405}$
 $= \frac{1015}{405}$
 $= \frac{1015}{405}$
 $= \frac{-15}{405} \times \frac{1}{100}$
 $= \frac{1015}{400}$
 $= \frac{1015}{100}$
 $= \frac{1015}{100}$

Downloaded from www.studiestoday.com

$$= \frac{592}{126} = \frac{296}{63}$$

$$\therefore \ \tfrac{-16}{7} \times \left(\tfrac{-8}{9} + \tfrac{-7}{6} \right) = \left(\tfrac{-16}{7} \times \tfrac{-8}{9} \right) + \left(\tfrac{-16}{7} \times \tfrac{-7}{6} \right)$$

Q8.

Answer:

Commutative property

Associative property

Distributive property

Property of multiplicative identity

Property of multiplicative inverse

Multiplicative property of 0

Q9.

Answer:

- (i) 1
- (ii) no
- (iii) 1; -1
- (iv) not
- (v) 1a
- (vi) a
- (vii) positive
- (viii) negative

Rational Numbers Ex 1E

Q1. Answer:

Q4.

Answer:

Let the number be x. Now,

Now,
$$\mathbf{x} \times (-12) = -9$$

$$\Rightarrow$$
 x = $-9 \div (-12)$

$$\Rightarrow$$
 x = $\left(-9\right) \times \frac{1}{-12}$

$$\Rightarrow$$
 $\mathbf{x} = \frac{-9}{-12}$

$$\Rightarrow \mathbf{x} = \frac{3}{4}$$

Q5.

Answer:

Let the number be x.

Now,

$$\mathbf{x} \times \frac{-4}{3} = \frac{-16}{9}$$

$$\Rightarrow$$
 $\mathbf{x} = \frac{-16}{9} \div \frac{-4}{3}$

$$\Rightarrow$$
 $\mathbf{x} = \frac{-16}{9} imes \frac{3}{-4}$

$$\Rightarrow$$
 $\mathbf{x} = \frac{-16 \times 3}{9 \times (-4)}$

$$\Rightarrow x = \frac{48}{36}$$

$$\Rightarrow x = \frac{4}{3}$$

Q6.

Answer:

Let the number be x.

Now,

$$\mathbf{x} \times \frac{-15}{56} = \frac{-5}{7} \\
\Rightarrow \mathbf{x} = \frac{-5}{7} \div \frac{-15}{56} \\
\Rightarrow \mathbf{x} = \frac{-5}{7} \times \frac{56}{-15} \\
\Rightarrow \mathbf{x} = \frac{280}{105} \\
\Rightarrow \mathbf{x} = \frac{280 \div 5}{105 \div 5}$$

$$\Rightarrow$$
 $\mathbf{x} = \frac{56}{21}$

$$\Rightarrow \mathbf{x} = \frac{\overset{21}{56 \div 7}}{\overset{21}{21 \div 7}}$$

$$\Rightarrow \mathbf{x} = \frac{8}{3}$$

Q7.

Answer:

Let the number be x. Now,

$$\mathbf{x} \times \frac{-8}{39} = \frac{1}{26}$$
$$\Rightarrow \mathbf{x} = \frac{1}{2} \div$$

$$\Rightarrow \mathbf{x} = \frac{1}{26} \div \frac{-8}{39}$$
$$\Rightarrow \mathbf{x} = \frac{1}{26} \times \frac{39}{-8}$$

$$\Rightarrow \mathbf{x} = \frac{39}{-208}$$

$$\Rightarrow \mathbf{x} = \frac{39}{-208}$$

$$\Rightarrow \mathbf{x} = \frac{39 \times -1}{-208 \times -1}$$

$$\begin{array}{l} \Rightarrow \mathbf{x} = \frac{-39}{208} \\ \Rightarrow \mathbf{x} = \frac{-39 \div 13}{208 \div 13} \end{array}$$

$$\Rightarrow \mathbf{x} = \frac{208 \div 13}{208 \div 13}$$

$$\Rightarrow \mathbf{x} = \frac{-3}{16}$$

Q8.

Answer:

Let the number be x.

Now,

$$\begin{array}{l} -\frac{33}{8} \div \mathbf{x} = \frac{-11}{2} \\ \Rightarrow \frac{-33}{8} \times \frac{1}{\mathbf{x}} = \frac{-11}{2} \\ \Rightarrow \frac{1}{\mathbf{x}} = \frac{-11}{2} \div \frac{-33}{8} \\ \Rightarrow \frac{1}{\mathbf{x}} = \frac{-11}{2} \times \frac{8}{-33} \\ \Rightarrow \frac{1}{\mathbf{x}} = \frac{88}{66} \end{array}$$

$$\Rightarrow \frac{1}{\mathbf{x}} = \frac{66}{66}$$

$$\Rightarrow \frac{1}{\mathbf{x}} = \frac{4}{3}$$

$$\Rightarrow$$
 $\mathbf{x} = \frac{3}{4}$

(Reciprocal of $\frac{4}{3}$)

Q9.

Answer:

$$\begin{pmatrix} \frac{13}{5} + \frac{-12}{7} \end{pmatrix} \div \begin{pmatrix} \frac{-31}{7} \times \frac{1}{-2} \end{pmatrix}$$

$$= \begin{pmatrix} \frac{91 - 60}{35} \end{pmatrix} \div \begin{pmatrix} \frac{-31}{-14} \end{pmatrix}$$

$$= \begin{pmatrix} \frac{31}{35} \end{pmatrix} \div \begin{pmatrix} \frac{31}{14} \end{pmatrix}$$

$$= \begin{pmatrix} \frac{31}{35} \end{pmatrix} \times \begin{pmatrix} \frac{14}{31} \end{pmatrix}$$

$$= \frac{14}{35}$$

$$= \frac{14 \div 7}{35 \div 7}$$

$$= \frac{2}{5}$$

Q10.

Answer:

Q11.

Answer:

(i)
Let
$$\frac{9}{8} \div \mathbf{x} = \frac{-3}{2}$$

 $\Rightarrow \frac{9}{8} \times \frac{1}{\mathbf{x}} = \frac{-3}{2}$
 $\Rightarrow \frac{1}{\mathbf{x}} = \frac{-3}{2} \div \frac{9}{8}$
 $\Rightarrow \frac{1}{\mathbf{x}} = \frac{-3}{2} \times \frac{8}{9}$
 $\Rightarrow \frac{1}{\mathbf{x}} = \frac{-24}{18}$
 $\Rightarrow \frac{1}{\mathbf{x}} = \frac{-4}{3}$
 $\Rightarrow \mathbf{x} = \frac{-3}{4}$

Reciprocal of $\frac{-4}{3}$

(ii)
Let
$$\mathbf{x} \div \left(\frac{-7}{5}\right) = \frac{10}{19}$$

 $\Rightarrow \mathbf{x} \times \left(\frac{5}{-7}\right) = \frac{10}{19}$
 $\Rightarrow \mathbf{x} = \left(\frac{10}{19}\right) \div \left(\frac{5}{-7}\right)$
 $\Rightarrow \mathbf{x} = \frac{10}{19} \times \frac{-7}{5}$
 $\Rightarrow \mathbf{x} = \frac{-14}{19}$

(iii)
Let
$$\mathbf{x} \div \left(-3\right) = \frac{-4}{15}$$

 $\Rightarrow \mathbf{x} \times \left(\frac{1}{-3}\right) = \frac{-4}{15}$
 $\Rightarrow \mathbf{x} = \frac{-4}{15} \times \left(-3\right)$
 $\Rightarrow \mathbf{x} = \frac{12}{15}$
 $\Rightarrow \mathbf{x} = \frac{4}{5}$

(iv)
Let
$$\left(-12\right) \div \mathbf{x} = \frac{-6}{5}$$

 $\Rightarrow \left(-12\right) \times \frac{1}{\mathbf{x}} = \frac{-6}{5}$
 $\Rightarrow \frac{1}{\mathbf{x}} = \frac{-6}{5} \div \left(-12\right)$
 $\Rightarrow \frac{1}{\mathbf{x}} = \frac{-6}{5} \times \frac{1}{-12}$
 $\Rightarrow \frac{1}{\mathbf{x}} = \frac{1}{10}$
 $\Rightarrow \mathbf{x} = 10$

Q12.

Δnswer

(i) No, rational numbers are not closed under division in general.

 $\frac{a}{0} = \infty$; it is not a rational number.

(ii) No

$$\begin{split} &\frac{a}{b} \div \frac{c}{d} = \frac{a}{b} \times \frac{d}{c} = \frac{ad}{bc} \\ &\text{Also,} \\ &\frac{c}{d} \div \frac{a}{b} = \frac{c}{d} \times \frac{b}{a} = \frac{cb}{da} \text{ Thus, } \frac{a}{b} \div \frac{c}{d} \neq \frac{c}{d} \div \frac{a}{b} \end{split}$$

Therefore, division is not commutative

(iii) No, rational numbers are not associative under division.

$$\frac{a}{b} \div \left(\frac{c}{d} \div \frac{e}{f}\right) \neq \left(\frac{a}{b} \div \frac{c}{d}\right) \div \frac{e}{f}$$

(iv) No, we cannot divide 1 by 0. The answer will be∞, which is not defined.

Downloaded from www.studiestoday.com RS Aggarwal Solutions Class 8 Mathematics Rational Numbers Ex 1F

Q1.
Answer:
Required number
$$= \frac{1}{2} \left(\frac{1}{4} + \frac{1}{3} \right)$$
 $= \frac{1}{2} \left(\frac{3+4}{12} \right)$
 $= \left(\frac{1}{2} \times \frac{7}{12} \right)$
 $= \frac{7}{24}$

Q2.
Answer:
Required Number $= \frac{1}{2} \times \left(2 + 3 \right)$
 $= \frac{5}{2}$

Q3.
Answer:
Required number $= \frac{1}{2} \times \left(\frac{-1}{3} + \frac{1}{2} \right)$
 $= \frac{1}{2} \times \left(\frac{-2+3}{6} \right)$
 $= \frac{1}{2} \times \frac{1}{6}$
 $= \frac{1}{12}$

Q4.

Answer: Required number
$$= \frac{1}{2} \times (-3 - 2)$$

 $= \frac{1}{2} \left(-5 \right)$
 $= \frac{-5}{2}$
We know: $-3 < \frac{-5}{2} < -2$
Rational number between -3 and $\frac{-5}{2} = \frac{1}{2} \times \left(-3 - \frac{5}{2} \right)$
 $= \frac{1}{2} \left(\frac{-6 - 5}{2} \right)$
 $= \frac{1}{2} \times \frac{-11}{2}$
 $= \frac{-11}{4}$
Thus, the required numbers are $\frac{-5}{2}$ and $\frac{-11}{4}$.

Q5.

Answer:

Rational number between 4 and 5: $\frac{1}{2}(4+5)$ Rational number between 4 and $\frac{9}{2}$: $\frac{1}{2}\left(4+\frac{9}{2}\right)$ $=\frac{1}{2}\left(\frac{8+9}{2}\right)$ $=\frac{1}{2}\left(\frac{17}{2}\right)$

Rational number between $\frac{9}{2}$ and 5:

$$\frac{1}{2} \left(\frac{9}{2} + 5 \right)$$

$$= \frac{1}{2} \left(\frac{9+10}{2} \right)$$

$$= \frac{19}{4}$$
We have

We know: $4 < \frac{17}{4} < \frac{9}{2} < \frac{19}{4} < 5$

O6.

Answer:

Rational number between $\frac{2}{3}$ and $\frac{3}{4}$: $\frac{1}{2}\left(\frac{2}{3}+\frac{3}{4}\right)$

$$\frac{1}{2} \left(\frac{1}{3} + \frac{1}{4} \right)$$

$$= \frac{1}{2} \left(\frac{8+9}{12} \right)$$

$$= \frac{17}{24}$$

We know: $\frac{2}{3} < \frac{17}{24} < \frac{3}{4}$

Rational number between $\frac{2}{3}$ and $\frac{17}{24}$:

$$\begin{aligned} &\frac{1}{2} \left(\frac{2}{3} + \frac{17}{24} \right) \\ &= \frac{1}{2} \left(\frac{16 + 17}{24} \right) \\ &= \frac{1}{2} \left(\frac{33}{24} \right) \\ &= \frac{33}{48} = \frac{33 \div 3}{48 \div 3} = \frac{11}{16} \end{aligned}$$

Rational number between $\frac{17}{24}$ and $\frac{3}{4}$:

$$\frac{1}{2} \left(\frac{17}{24} + \frac{3}{4} \right)$$
$$= \frac{1}{2} \left(\frac{17 + 18}{24} \right)$$

$$=\frac{1}{2}\left(\frac{35}{24}\right)$$

$$=\frac{35}{48}$$
We know:
$$\frac{2}{3}<\frac{11}{16}<\frac{17}{24}<\frac{35}{48}<\frac{3}{4}$$
Thus, the three rational numbers are $\frac{11}{16}$, $\frac{17}{24}$ and $\frac{35}{48}$.

Q8.

Answer:

We may write:
$$-1 = \frac{-10}{10}$$

and

$$2 = \frac{20}{10}$$

Rational numbers between -1 and 2:

$$\tfrac{-9}{10}\,,\,\,\tfrac{-8}{10}\,,\,\,\tfrac{-7}{10}\,,\,\,\tfrac{-6}{10}\,,\,\,\tfrac{-5}{10}\,,\,\,\tfrac{-4}{10}\,,\ldots,\tfrac{14}{10}\,,\,\,\tfrac{15}{10}\,,\,\,\tfrac{16}{10}\,,\,\,\tfrac{17}{10}\,,\,\,\tfrac{18}{10}\,\,\,\text{and}\,\,\,\tfrac{19}{10}$$

We can take any 12 numbers out of these.

Downloaded from www.studiestoday.com **RS Aggarwal Solutions Class 8 Mathematics Rational Numbers Ex 1G**

Q1.

Answer:

Length of the rope when two pieces of lengths $2\frac{3}{5}$ m and $3\frac{3}{10}$ m are cut off = Total length of the rope - Length of the two cut off pieces

$$\therefore 11 - \left(2\frac{3}{5} + 3\frac{3}{10}\right)$$

$$\begin{split} 2\,\frac{3}{5} + 3\,\frac{3}{10} &\Rightarrow \left(2 + \frac{3}{5}\right) + \left(3 + \frac{3}{10}\right) \\ &= \frac{13}{5} + \frac{33}{10} \\ \text{LCM of 5 and 10 is 10, i.e., } \left(5 \times 1 \times 2\right) \end{split}$$

We have:

$$\frac{(13\times2)+(33\times1)}{10} \\
= \frac{26+33}{10} \\
= \frac{59}{10}$$

$$\therefore 2\frac{3}{5} + 3\frac{3}{10} = \frac{59}{10}$$

 $\therefore 2\,\frac{3}{5}+3\,\frac{3}{10}=\frac{59}{10}$ Length of the remaining rope $=11-\frac{59}{10}$

$$= \frac{110-59}{10}$$

$$= \frac{51}{10}$$

$$= 5\frac{1}{10} \text{ m}$$

Therefore, the length of the remaining rope is $5\frac{1}{10}$ m.

Q2.

Answer

Weight of rice in the drum = Weight of the drum full of rice - Weight of the empty drum

$$= 40 \frac{1}{6} - 13 \frac{3}{4}$$

$$= \left(40 + \frac{1}{6}\right) - \left(13 + \frac{3}{4}\right)$$

$$= \frac{241}{6} - \frac{55}{4}$$

$$= \frac{241}{6} + \left(\text{Additive inverse of } \frac{55}{4}\right)$$

$$= \frac{482 - 165}{12}$$

$$= \frac{317}{12}$$

$$= 26 \frac{5}{12} \text{ kg}$$

Therefore, the weight of rice in the drum is $26\frac{5}{12}$ kg

Q3.

Answer:

Weight of pears in the basket = Weight of the basket containing three types of fruits - (Weight of apples + Weight of oranges)

$$=19\frac{1}{3}-\left(8\frac{1}{9}+3\frac{1}{6}\right)$$

Now.

$$\left(8\frac{1}{9} + 3\frac{1}{6}\right) \Rightarrow \left(8 + \frac{1}{9}\right) + \left(3 + \frac{1}{6}\right) \\
= \frac{73}{9} + \frac{19}{6}$$

LCM of 9 and 6 is 18, that is, $(3 \times 3 \times 2)$.

We have:

$$\frac{(73\times2)+(19\times3)}{18} = \frac{146+57}{18} = \frac{203}{18}$$

$$\therefore 8\frac{1}{9} + 3\frac{1}{6} = \frac{203}{18}$$

Weight of pears in the basket =
$$19\frac{1}{3} - \frac{203}{18}$$

= $\left(19 + \frac{1}{3}\right) - \frac{203}{18}$
= $\frac{58}{3} - \frac{203}{18}$
= $\frac{58}{3} + \left(\text{Additive inverse of } \frac{203}{18}\right)$
= $\frac{348 - 203}{18}$
= $\frac{145}{18}$
= $8\frac{1}{18}$ kg

Therefore, the weight of the pears in the basket is $8\frac{1}{18}$ kg

Q4.

Answer:

Money saved by the rickshaw puller = Total money earned - (Earnings spent on tea and snacks + Earnings spent on food + Earnings spent on repairs)

$$= 80 - \left(13\frac{3}{5} + 25\frac{1}{2} + 4\frac{2}{5}\right)$$

$$= 80 - \left(\left(13 + \frac{3}{5}\right) + \left(25 + \frac{1}{2}\right) + \left(4 + \frac{2}{5}\right)\right)$$

$$= 80 - \left(\frac{68}{5} + \frac{51}{2} + \frac{22}{5}\right)$$

Now,

$$\begin{aligned} &\frac{68}{5} + \frac{51}{2} + \frac{22}{5} = \frac{(68 \times 2) + (51 \times 5) + (22 \times 2)}{10} \\ &= \frac{136 + 255 + 44}{10} \\ &= \frac{435}{10} \\ &= \frac{87}{2} \end{aligned}$$

$$\therefore \frac{68}{5} + \frac{51}{2} + \frac{22}{5} = \frac{87}{2}$$

Downloaded from www.studiestoday.com RS Aggarwal Solutions Class 8 Mathematics Money saved by the rickshaw puller = $80 - \frac{87}{2}$

Money saved by the rickshaw puller $=80-\frac{87}{2}$ $=80+\left(\text{Additive inverse of }\frac{87}{2}\right)$ $=\frac{160-87}{2}$ $=\frac{73}{2}$ $=\text{Rs }36\,\frac{1}{2}$

Therefore, the amount of money saved by the rickshaw puller is Rs $36\frac{1}{2}$

Q5.

Answer:

$$\begin{aligned} \text{Cost of } 3\,\frac{2}{5} \text{ m cloth} &= 3\,\frac{2}{5} \times 36\,\frac{3}{4} \\ &= \left(3+\frac{2}{5}\right) \times \left(36+\frac{3}{4}\right) \\ &= \frac{17}{5} \times \frac{147}{4} \\ &= \frac{17 \times 147}{5 \times 4} \\ &= \frac{2499}{20} \\ &= \text{Rs } 124\,\frac{19}{20} \end{aligned}$$

Therefore, the cost of $3\frac{2}{5}$ m cloth is Rs $124\frac{19}{20}$.

Q6.

Answer:

Distance covered by the car in $7\frac{1}{2}$ hours = $7\frac{1}{2} \times 40\frac{2}{5}$ [Distance = Speed \times Time]

$$= \left(7 + \frac{1}{2}\right) \times \left(40 + \frac{2}{5}\right)$$

$$= \frac{15}{2} \times \frac{202}{5}$$

$$= \frac{15 \times 202}{10}$$

$$= \frac{3030}{10}$$

$$= 303 \text{ km}$$

Therefore, distance covered by the car is $303\ km$

Q7.

Answer:

Area of the rectangular park = Length of the park \times Breadth of the park (: Area of rectangle = Length \times Breadth)

$$= 36 \frac{3}{5} \times 16 \frac{2}{3}$$

$$= \left(36 + \frac{3}{5}\right) \times \left(16 + \frac{2}{3}\right)$$

$$= \frac{183}{5} \times \frac{50}{3}$$

$$= \frac{183 \times 50}{5 \times 3}$$

$$= \frac{9150}{15}$$

$$= 610 \text{ m}^2$$

Therefore, the area of the rectangular park is $610\ m^2$.

Q8.

Δnswer

Area of the square plot = Side \times Side = $(\text{Side})^2 = a^2$ (Because the area of the square is a^2 , where a is the side of the square)

$$= 8\frac{1}{2} \times 8\frac{1}{2}$$

$$= \left(8 + \frac{1}{2}\right) \times \left(8 + \frac{1}{2}\right)$$

$$= \frac{17}{2} \times \frac{17}{2}$$

$$= \frac{17 \times 17}{2 \times 2}$$

$$= \frac{289}{4}$$

$$= 72\frac{1}{4} \text{ m}^2$$

Therefore, the area of the square plot is $72\frac{1}{4}$ m².

Q10.

Answer:

Distance covered by the aeroplane in
$$4\frac{1}{6}$$
 hours = $4\frac{1}{6}\times 1020$
$$= \left(4+\frac{1}{6}\right)\times 1020$$

$$= \frac{25}{6}\times 1020$$

$$= \frac{25}{6}\times \frac{1020}{1}$$

$$= \frac{25\times 1020}{6\times 1}$$

$$= \frac{25500}{6}$$

Therefore, the distance covered by the aeroplane is $4250\ km$

Q11.

Answer:

Cost of one metre of cloth =
$$57\frac{3}{4} \div 3\frac{1}{2}$$

= $\left(57 + \frac{3}{4}\right) \div \left(3 + \frac{1}{2}\right)$
= $\frac{231}{4} \div \frac{7}{2}$
= $\frac{231}{4} \times \frac{2}{7}$
= $\frac{231 \times 2}{4 \times 7}$
= $\frac{462}{28}$
= $16\frac{14}{28}$
= $\mathbf{Rs} \ 16\frac{1}{2}$

Therefore, the cost of one metre of cloth is Rs $16\frac{1}{2}$

Q12.

Answer:

Length of each piece of the cord =
$$71\frac{1}{2} \div 26$$

= $\left(71 + \frac{1}{2}\right) \div 26$
= $\frac{143}{2} \div 26$
= $\frac{143}{2} \cdot \frac{26}{1}$
= $\frac{143}{2} \times \frac{1}{26}$
= $\frac{143 \times 1}{2 \times 26}$
= $\frac{143}{52}$
= $\frac{9}{4}$

Hence, the length of each piece of the cord is $2\frac{3}{4}$ metres.

Q13.

Answer

Area of a room = Length × Breadth Thus, we have: $65\frac{1}{4} = \text{Length} \times 5\frac{7}{16}$ $\text{Length} = 65\frac{1}{4} \div 5\frac{7}{16}$ $= \left(65 + \frac{1}{4}\right) \div \left(5 + \frac{7}{16}\right)$ $= \frac{261}{4} \div \frac{87}{87}$ $= \frac{261 \times 16}{4 \times 87}$ $= \frac{261 \times 16}{348}$ = 12 m

Hence, the length of the room is 12 metres.

Q14.

Answer:

Let the other fraction be x.

Now, we have:

$$\begin{array}{l} 9\,\frac{3}{7}\times x = 9\,\frac{3}{5} \\ \Rightarrow x = 9\,\frac{3}{5} \div 9\,\frac{3}{7} \\ &= \left(9+\frac{3}{5}\right) \div \left(9+\frac{3}{7}\right) \\ &= \frac{48}{5} \div \frac{6}{7} \\ &= \frac{48}{5} \times \frac{7}{66} \\ &= \frac{48\times 7}{5\times 66} \\ &= \frac{336}{330} \\ &= \frac{56}{55} \\ &= 1\,\frac{1}{55} \end{array}$$

Hence, the other fraction is $1\frac{1}{55}$

Q15.

Answer:

If $\frac{5}{8}$ of the students are boys, then the ratio of girls is $1-\frac{5}{8}$, that is, $\frac{3}{8}$

Now, let x be the total number of students.

Thus, we have:

$$\frac{3}{8} x = 240
\Rightarrow x = 240 \div \frac{3}{8}
= 240 \times \frac{8}{3}
= \frac{240}{1} \times \frac{8}{3}
= \frac{240 \times 8}{1 \times 3}
= \frac{1920}{3}
= 640$$

Hence, the total number of students is 640.

Now,

Number of boys = Total number of students - Number of girls = 640 - 240

$$=640-240$$

= 400

Q16.

Answer

Ratio of the read book = $\frac{7}{9}$ Ratio of the unread book = $1-\frac{7}{9}$

$$=\frac{2}{9}$$

Let x be the total number of pages in the book.

Thus, we have:

$$\frac{2}{9} \times x = 40$$

$$\Rightarrow x = 40 \div \frac{2}{9}$$

$$= 40 \times \frac{9}{2}$$

$$= \frac{40}{1} \times \frac{9}{2}$$

$$= \frac{40 \times 9}{1 \times 2}$$

$$= \frac{300}{2}$$

Hence, the total number of pages in the book is 180.

Q17.

Answer:

Amount of money spent on notebooks = $300 \times \frac{1}{3}$

$$= \frac{300}{1} \times \frac{1}{3}$$
$$= \frac{300}{3}$$
$$= 100$$

 \therefore Money left after spending on notebooks = 300-100 -200

Amount of money spent on stationery items from the remainder = $200 \times \frac{1}{4}$ = $\frac{200}{1} \times \frac{1}{4}$ = $\frac{200}{4}$

 \therefore Amount of money left with Rita = 200-50= $\mathbf{Rs}\ 150$

Q18.

Answer:

Total amount of money Amit earns = Rs 16000 Amount of money spent on food = $16000 \times \frac{1}{4}$ = $\frac{16000}{1} \times \frac{1}{4}$ = $\frac{16000}{4}$ = Rs 4000

: Amount of money left after spending on food =16000-4000 $= {\rm Rs} \,\, 12000$

Amount of money spent on house rent from the remainder $= 12000 \times \frac{3}{10}$ $= \frac{12000}{1} \times \frac{3}{10}$ $= \frac{12000 \times 3}{1 \times 10}$ $= \frac{36000}{10}$ = Rs 3600

 \therefore Amount of money left after spending on food and house rent = 12000 - 3600

= Rs 8400 Amount of money spent on children's education from the remainder= $8400\times\frac{5}{21}$

$$=\frac{8400}{1}\times\frac{5}{21}$$

Downloaded from www.studiestoday.com RS Aggarwal Solutions Class 8 Mathematics $=\frac{42000}{21}$

$$= \frac{42000}{21}$$
= Rs 2000

 \therefore Amount of money left= 8400-2000=Rs 6400

Hence, the amount of money left with Amit is Rs 6400.

019.

Answer:

Let x be the required number.

We know that $\frac{3}{5}$ of the number exceeds its $\frac{2}{7}$ by 44.

That is,

$$\frac{\frac{3}{5} \times x = \frac{2}{7} \times x + 44}{\frac{3}{5} \times x - \frac{2}{7} \times x = 44}$$

$$\left(\frac{3}{5} - \frac{2}{7}\right) \times x = 44$$

$$\left(\frac{3}{5} + \text{Additive inverse of } \frac{2}{7}\right) \times x = 44$$

$$\left(\frac{21 - 10}{35}\right) \times x = 44$$

$$\frac{11}{35} \times x = 44$$

$$x = 44 \div \frac{11}{35}$$

$$= 44 \times \frac{35}{11}$$

$$= \frac{44 \times 35}{1 \times 11}$$

$$= \frac{44 \times 35}{1 \times 11}$$

Q20.

Answer:

Ratio of spectators in the open $=1-\frac{2}{7}$

$$=\frac{5}{7}$$

= 140

Total number of spectators in the open = x

Then, $\frac{5}{7} \times x = 15000$

$$\Rightarrow x = 15000 \div \frac{5}{7}$$

$$= 15000 \times \frac{7}{5}$$

$$= \frac{15000}{1} \times \frac{7}{5}$$

$$= \frac{15000 \times 7}{1 \times 5}$$

$$= \frac{15500}{5}$$

$$= 21000$$

Hence, the total number of spectators is 21,000

Downloaded from www.studiestoday.com RS Aggarwal Solutions Class 8 Mathematics Rational Numbers Ex 1H

Q2.

Answer:

(b)
$$\frac{-28}{15}$$
 $\frac{8}{-15} = \frac{-8}{15}$ and $\frac{4}{-3} = \frac{-4}{3}$

Now, we have:

$$\left(\frac{8}{-15} + \frac{4}{-3}\right) = \left(\frac{-8}{15} + \frac{-4}{3}\right)$$

LCM of 15 and 3 is $(3 \times 5 \times 1)$, that is,15

$$\frac{-8}{15} + \frac{-4}{3} = \frac{1 \times (-8) + 5 \times (-4)}{15}$$

$$= \frac{(-8) + (-20)}{15}$$

$$= \frac{-28}{15}$$

Q3.

Answer:

$$\frac{7}{-26} = \frac{-7}{26}$$

Now, we have:

$$\left(\frac{7}{-26} + \frac{16}{39}\right) = \left(\frac{-7}{26} + \frac{16}{39}\right)$$

LCM of 26 and 39 is 1014, that is, (29 \times 1 \times 36).

(a)
$$\frac{11}{78}$$

 $\left(\frac{-7}{26} + \frac{16}{39}\right) = \frac{39 \times \left(-7\right) + 26 \times 16}{1014}$
 $= \frac{\left(-273\right) + 416}{1014}$
 $= \frac{143}{1014}$
 $= \frac{11}{78}$

Q4.

Answer:

(b)
$$\frac{16}{7}$$

$$3=\frac{3}{1}$$
 and $\frac{5}{-7}=\frac{-5}{7}$

Now, we have:

$$\left(3 + \frac{5}{-7}\right) = \left(\frac{3}{1} + \frac{-5}{7}\right)$$

LCM of 1 and 7 is 7

Q5.

Answer:

(d)
$$\frac{-67}{8}$$
 $\frac{31}{-4} = \frac{-31}{4}$

We have:

$$\left(\frac{31}{-4} + \frac{-5}{8}\right) = \left(\frac{-31}{4} + \frac{-5}{8}\right)$$

LCM of 4 and 8 is 8, that is, $(4 \times 1 \times 2)$.

Q6.

Answer:

(b)
$$\frac{-17}{20}$$

Let the required number be x.

Now,

$$\frac{7}{12} + x = \frac{-4}{15}$$

$$\Rightarrow x = \left(\frac{-4}{15} + \frac{-7}{12}\right)$$

$$= \frac{4 \times (-4) + 5 \times (-7)}{60}$$
$$= \frac{(-16) + (-35)}{60}$$

$$=\frac{-51}{60}$$

Answer

(c)
$$\frac{-13}{60}$$

Using the commutative and associative laws, we can arrange the terms in any suitable manner. Using this rearrangement property, we have:

$$\frac{2}{3} + \frac{-4}{5} + \frac{7}{15} + \frac{-11}{20} = \left(\frac{2}{3} + \frac{7}{15}\right) + \left(\frac{-4}{5} + \frac{-11}{20}\right)$$

$$= \frac{(10+7)}{15} + \frac{[(-16)+(-11)]}{20}$$

$$= \left(\frac{17}{15} + \frac{-27}{20}\right)$$

$$= \frac{[68+(-81)]}{60}$$

$$= \frac{-13}{28}$$

Q8.

Answer:

(b)
$$\frac{11}{3}$$

Let the other number be x.

Now.

$$x + (-5) = \frac{-4}{3}$$

$$\Rightarrow x = \frac{-4}{3} + (\text{Additive inverse of } -5)$$

$$\Rightarrow x = \frac{-4}{3} + 5$$

$$= \frac{-4}{3} + \frac{5}{1}$$

$$= \frac{(-4) + 15}{3}$$

$$= \frac{11}{3}$$

Q9.

Answer:

(C)
$$\frac{1}{21}$$

Let the required number be x.

Now,

$$\begin{array}{l} \frac{-5}{7} + x = \frac{-2}{3} \\ \Rightarrow x = \frac{-2}{3} + \left(\text{Additive inverse of } \frac{-5}{7} \right) \\ \Rightarrow x = \left(\frac{-2}{3} + \frac{5}{7} \right) \\ = \frac{\left(-14 \right) + 15}{21} \\ = \frac{1}{21} \end{array}$$

Q10.

Answer:

(d)
$$\frac{-5}{2}$$

Let the required number be x

Now,

$$\frac{-5}{3} - x = \frac{5}{6}
\Rightarrow x = \left(\frac{-5}{3} - \frac{5}{6}\right)
= \frac{-10 - 5}{6}
= \frac{-15}{6}
= \frac{-5}{2}$$

Thus, the required number is $\frac{-5}{2}$

Q11.

Answer:

(b)
$$\frac{-7}{3}$$

$$\left(-\frac{3}{7}\right)^{-1} \Rightarrow \text{Reciprocal of } \frac{-3}{7}$$

The reciprocal of $\frac{-3}{7}$ is $\frac{7}{-3}$, i.e., $\frac{-7}{3}$

Q12.

Answer:

(a)
$$\frac{-2}{3}$$

Let the other number be x.

$$x \times \frac{14}{27} = \frac{-28}{81}$$

$$\Rightarrow x = \frac{-28}{81} \div \frac{14}{27}$$

$$= \frac{-28}{81} \times \frac{27}{14}$$

$$= \frac{(-28) \times 27}{81 \times 14}$$

$$= \frac{-(28 \times 27)}{81 \times 14}$$

$$=\frac{(-28)\times 27}{81\times 14}$$

$$=\frac{-(28\times27)}{81\times14}$$

$$=\frac{\sqrt{2}}{9\times1}$$

Thus, the other number is
$$\frac{-2}{3}$$

Q13.

Answer:

(c)
$$\frac{32}{75}$$

Let the other number be x.

Now,

$$x imes rac{-15}{4} = rac{-16}{35}$$

$$x imes rac{-15}{4} = rac{-16}{35} \ \Rightarrow x = rac{-16}{35} rac{-15}{14}$$

$$= \frac{-16}{35} \times \frac{14}{-15}$$
$$= \frac{-(16 \times 14)}{-(35 \times 15)}$$

$$= \frac{1}{-(35 \times 15)}$$

$$= \frac{16 \times 14}{35 \times 15} = \frac{224}{525} = \frac{32}{75}$$

Thus, the other number is $\frac{32}{75}$

Q14.

Answer:

(d)
$$\frac{7}{5}$$

Now,

$$-\tfrac{3}{5}-x=-2$$

$$\Rightarrow -rac{3}{5} = -2 + x$$

$$\Rightarrow x = \left(-\frac{3}{5} + 2\right)$$

$$\Rightarrow x = \frac{(-3+10)}{5}$$

$$\Rightarrow x = \frac{7}{5}$$

Thus, the required number is $\frac{7}{5}$

Q15.

Answer:

(C) $\frac{1}{3}$

Let the other number be x.

Now.

$$x + \left(-\frac{10}{3}\right) = -3$$

$$\Rightarrow x = -3 + \left(\text{Additive inverse of } -\frac{10}{3}\right)$$

$$\Rightarrow x = \left(-3 + \frac{10}{3}\right)$$

$$= \frac{-3}{1} + \frac{10}{3}$$

$$= \frac{\left(-9 + 10\right)}{3}$$

$$= \frac{1}{3}$$

Thus, the other number is $\frac{1}{3}$

Q16.

Answer:

(b)
$$\frac{-49}{71}$$
 and (c) $\frac{-9}{16}$

The numbers $\frac{-49}{71}$ and $\frac{-9}{16}$ are in the standard form because they have no common divisor other than 1 and their denominators are positive.

Q17.

Answer:

(a)
$$\frac{-3}{10}$$

$$\begin{pmatrix} \frac{-9}{16} \times \frac{8}{15} \end{pmatrix} = \frac{-9 \times 8}{16 \times 15}$$
$$= \frac{-72}{240}$$
$$= \frac{-3}{10}$$

Q18.

Answer:

(d)
$$\frac{-5}{6}$$

$$\frac{-5}{9} \div \frac{2}{3} = \frac{-5}{9} \times \frac{3}{2}$$

$$= \frac{-5 \times 3}{9 \times 2}$$

$$= \frac{-15}{18}$$

$$-5$$

Q19.

(d)
$$\frac{-5}{6}$$

Let
$$\frac{4}{9} \div \frac{a}{b} = \frac{-8}{15}$$

Now,

$$\frac{4}{9} \times \frac{b}{a} = \frac{-8}{15}$$
$$\Rightarrow \frac{b}{a} = \frac{-8}{15} \times \frac{9}{4}$$

$$=\frac{-6}{5}$$

$$\Rightarrow \frac{a}{b} = \frac{5}{-6}$$

 $=\frac{-5}{6}$ Hence, the missing number is $\frac{-5}{6}$.

Q20.

Answer:

(c)
$$\frac{5}{9}$$

Additive inverse of $\frac{-5}{9}$ is $\frac{5}{9}$

Q21.

Answer:

(c)
$$\frac{-4}{2}$$

Reciprocal of
$$\frac{-3}{4}$$
 is $\frac{4}{-3}$, i.e., $\frac{-4}{3}$.

Q22.

Answer:

(d)
$$\frac{-5}{24}$$

Rational number between
$$\frac{-2}{3}$$
 and $\frac{1}{4}=\frac{1}{2}\left(\frac{-2}{3}+\frac{1}{4}\right)$
$$=\frac{1}{2}\left(\frac{-8+3}{12}\right)$$

$$=\frac{1}{2}\times\frac{-5}{12}$$

$$=\frac{-5}{24}$$

Q23.

(b) is a negative rational number

The reciprocal of a negative rational number is a negative rational number.
